THE INTERROLL GROUP

The Interroll Group is a globally leading supplier of high-quality key products and services for internal logistics. The company, which is listed on the stock exchange and has its headquarters in Switzerland, employs some 2,600 people (in 2021) in 35 companies (in 2021) around the globe.

The solutions for our customers' daily logistical challenges are based on Interroll key products that are built on a worldwide common platform.

Conveyor Rollers

Interroll is the worldwide leading provider of conveyor rollers that can be found in a multitude of applications in internal logistics. For the roller production, we merge quality, flexibility and speed. More than 13 million rollers in 60,000 variants leave our plants worldwide every year. Our production is always order-driven, even for the smallest order quantities and, if desired, even with a delivery time of 24 hours. Proven.

Drives and Controls

Interroll is a leading manufacturer in the segment of DC motor rollers and drum motors.

Interroll RollerDrive and their controls are used in automated conveyor technology. Energy-efficient DC drives are installed in decentralized conveyor systems and, as a result, optimize energy demand and material handling. The bus interface enables integrating the zero pressure accumulation conveyor technology into Industry 4.0 systems.

Interroll Drum Motors are designed for use in belt conveyors and conveyor systems. These robust, high-quality belt drives enable the construction of maintenance-free, energy-efficient conveyor belt systems for the majority of industrial applications as well as for food processing, baggage handling and supermarket checkouts.

Conveyors & Sorters

The Modular Conveyor Platform (MCP) from Interroll offers highest flexibility: a broad spectrum of modules, consisting of roller conveyors, belt conveyors as well as key products such as transfer, high-performance diverts or spiral lifts, covers all requirements of the material handling.

The Interroll Crossbelt Sorters were developed with an eye on precision for fast and precise sorting of goods of all types from 50 g to 35 kg. More than 400 Interroll sorters are used every day by the largest CEP players and E-commerce enterprises worldwide.

The modular pallet conveyor platform (MPP) offers roller and chain conveyors as well as special conveyors such as transfers and turntables to create a fully integrated, robust, space-saving and energy-saving solution for high throughput handling of pallets.

With the Special Hygienic Conveyor (SHC), Interroll offers a proven modular platform specifically for packaged food applications - an easy to integrate platform made of stainless steel for which basic required hygienic standards have been taken into account.

The Light Conveyor Platform (LCP) is synonymous with quickly available and flexible predefined modules. It is primarily used in the production and manufacturing industry as well as in the area of assembly and automation.

Pallet & Carton Flow

Interroll Pallet Flow and Carton Flow are the first choice when it comes to rapid turnarounds and optimizing the storage and commissioning process. Thanks to its efficiency and robustness, Pallet Flow ensures long-term availability and more flexibility for peaks in orders. The compact design reduces space requirements by up to 50 percent compared to conventional solutions. The integrated TimePlus Separator as well as the Magnetic Speed Controller increase the safety of the work environment and significantly reduce the risk of damages to goods.

The Interroll Carton Flow solutions are efficient as well as ergonomic, and were developed to improve the commissioning output.

GENERAL TECHNICAL INFORMATION

PLATFORMS

Platforms

Interroll Conveyor Roller Series are arranged into five so-called platforms. Each platform is characterized by a certain type of bearing and certain materials – the two key factors for the operation and application possibilities of the products.

The following applies within a platform:

- The bearings and materials for the bearing housing and seal are identical
- The size of the bearings may differ
- The versions are produced by the combination of shaft/tube dimensions and drive heads as well as the materials

Platform 1100

Associated roller series		Catalog page
Gravity conveyor roller	1100	page 32
Polymer conveyor wheel	2130	page 138
Polymer conveyor wheel	2370	page 144
Wheel track	BU40 with polymer wheels	page 166

Application

- For gravity applications
- Particularly smooth operation of conveyor rollers
- Stainless steel version suitable for moist areas
- For lightweight and medium-heavy materials to be conveyed
- Not suitable for drive conveyors

Properties

Platform 1100 provides for cost-effective solutions and is particularly suitable for gravity applications under normal ambient temperatures.

For information about properties and application areas of the polymers used, please refer to the chapter Material Specification Material Specification.

Bearings and materials

The bearing is made of polymer with balls made of uncoated steel or stainless steel. The outer ring and inner cone of the bearing are made of polypropylene. The bearings are lubricated with a food-safe grease.

Platform 1200

Associated roller series		Catalog page
Steel conveyor roller	1200	page 38
Steel conveyor wheel	2200	page 142
Wheel track	BU40 with steel rollers	page 166

Application

- For temperature ranges outside of the limits for polymer
- For lightweight and medium-heavy materials to be conveyed
- For driven and non-driven conveyors

Properties

Platform 1200 is specifically designed for use in extreme ambient temperatures. All versions are antistatic.

Bearings and materials

The pressed steel bearing seats and internal rings of the ball bearing are hardened and galvanized zinc-plated. The shape of the ball bearing is designed specifically for conveyor rollers and tolerates greater deflection of the bearing than comparable precision ball bearings.

Platform 1450

Associated roller series		Catalog page
Heavy-duty universal conveyor roller	1450	page 44
Heavy-duty conveyor roller	3950	page 128

Application

- For particularly heavy-duty loads and heavy individual loads
- Suitable for extreme temperatures with steel bearing housings
- For driven and non-driven conveyors

Properties

Platform 1450 is specifically designed for high loads caused by heavy individual weights. One version is available for deep freeze applications.

The drive elements made of technopolymers are designed to be twist-proof with a form-fit connection with the tube. The steel drive heads and flanges are all galvanized zinc-plated after being welded to the tube for optimum corrosion protection. All of the welds run right around the tube, not just in certain areas. For information about properties and application areas of the polymers used, please refer to the chapter Material Specification Material specification.

Bearings and materials

The standard version bearings are precision ball bearings 6205 2RZ or 6204 2RZ. Depending on the series, the drive elements, such as sprockets or toothed belt drive heads, are made of fiberglass-reinforced polyamide and polyoxymethylene or steel. The bearing housing on the non-driven side and the seals are made of polyamide.

Platform 1500

Associated roller series		Catalog page
Slide bearing conveyor roller	1500	page 50
Omnivheel	2500	page 146
Omnimat module	2800	page 152
Wheel track	Floway	page 164

Application

- For wet and hygienic areas
- For lightweight and medium-heavy materials to be conveyed
- For driven and non-driven conveyors

Properties

Platform 1500 is specifically designed for use in hygienic areas and in areas at risk of corrosion.

All of the bearing housings are sealed internally so that liquids or other substances cannot penetrate the rollers. The conveyor rollers can be cleaned with conventional detergents.

For information about properties and application areas of the polymers used, please refer to the chapter Material Specification Material specification.

GENERAL TECHNICAL INFORMATION

PLATFORMS

Bearings and materials

The bearings are designed as slide bearings and are made of polymer (polyoxymethylene with the addition of polytetrafluorethylene (PTFE)) with a stainless steel shaft pin. The materials and surfaces of the bearing pair are aligned to each other so that the bearings can run dry without lubrication. The tubes are made of polymer or stainless steel. All of the materials are completely corrosion-proof.

Platform 1700

Application

- For universal use
- For particularly quiet conveyance at high speeds
- For lightweight and medium-heavy materials to be conveyed
- For driven and non-driven conveyors

Properties

Platform 1700 is designed for high loads at very low noise levels and provides the ultimate in flexibility with its different drive options. The bearing design comprising polyamide bearing housing, precision ball bearing and a polypropylene or polyamide seal produces an extremely quiet conveyor roller, which can simultaneously carry heavy loads. Bearing housings and belt drive heads are installed in the tubes in a form-fit way (flanging for steel tube and press-in edge for polymer tube). The unique feature about this platform 1700 is the tapered shaft-shuttle, which combines the benefits of a female threaded shaft and a spring-loaded shaft (cf. shaft-shuttle shaft design page 13).

For information about properties and application areas of the polymers used, please refer to the chapter Material Specification Material specification.

Bearings and materials

Sealed DIN precision ball bearings 6002 2RZ, 689 2Z and 6003 2RZ are used. They are greased with a silicon-free lubricant and have a secure bearing housing in the base of the roller thanks to a snap-on edge. In addition, the ball bearing 6002 2RZ is oiled or available in a stainless steel design. The integral polypropylene seal is fixed in the internal ring of the ball bearing and has three functions: Protection of the ball bearing against coarse dirt and splashing water, diameter compensation of shaft and internal ring as well as diverting axial forces into the ball bearing.

Platform 5000

Associated roller series	Catalog page
Steel ball transfer unit 5000	page 154
Polymer ball transfer unit 5500	page 160

Application

- For pushing, e.g. of steel or wooden plates
- For aligning medium-heavy and heavy materials

Properties

The platform 5000 is designed for omni-directional pushing or aligning of medium-heavy and heavy materials. The series differ in the following features:

- Housing design
- Fastener
- Material of housing
- Material of support balls
- Material of main balls
- Load capacities

Bearings and materials

The principle of the ball roller consists of several small support balls that support a larger main ball. The main ball can be made of polymer or steel, depending on the series. The housing can be of polyamide or steel.

Bearings

Interroll utilizes different bearings, such as slide bearings or special ball bearings made of polypropylene with steel balls. However, the following section describes only the precision ball bearings used by Interroll.

Further information on the bearing assemblies (ball bearings with bearing housings and seals) is provided in the Platforms chapter (Platforms) and under Material Specification (Material specification).

All precision ball bearings used are designed as 2RZ, except for type 689. The steel sealing discs form a narrow sealing gap, but are non-contacting. They ensure an optimal startup of the roller. The steel-reinforced rubber sealing lips (NBR) lie against the inner ring under external pressure and thus provide an exceptional sealing quality comparable to the 2RS version. The oil-lubricated version is characterized by its easy start and exceptional easy-running properties.

Precision ball bearings in accordance with DIN 625 have the following properties:

- Series 689, 60 and 62 standard DIN grooved ball bearings
- Excellent load capacity and operational life
- Precision ball race
- Extremely temperature-resistant
- Low-noise operation
- With stainless steel design: manufactured throughout from corrosion-proof material

All precision ball bearings are specified by Interroll beyond the requirements of DIN 625 for optimum, durable and constant operation. Interroll specifies the bearing play, lubrication and sealing etc.

GENERAL TECHNICAL INFORMATION

SHAFTS

Shafts

Shaft material

Interroll offers shafts made of three different materials or finishings:

- Uncoated steel
- Zinc-plated steel
- Stainless steel

All shafts are manufactured from cold-drawn steel. Interroll recommends to match the shaft material to the material of the side profile.

Zinc-plated shafts are cut from galvanized zinc-plated rod material, thus the front faces of the female threaded or spring-loaded shafts are always without zinc plating.

Male threaded shafts cannot be zinc-plated, otherwise they pose a risk of blocked threads due to the zinc layer. For this reason, Interroll recommends selecting either male threaded or flatted shafts in stainless steel to obtain adequate corrosion protection.

Manufacturing process

After the sawing process, the shafts are milled. Milling reduces deformations of the shaft ends or damages on the side profile during installation to a minimum. Furthermore, milling removes sharp burrs, thereby ruling out a risk of injuries. Hence, this creates not only safe, but also perfectly manageable rollers.

For threaded holes, the centering holes are drilled in a first step to ensure precisely centered threaded holes in the shaft.

Versions

Spring-loaded shaft

Spring-loaded shafts can be manufactured from round material or hex material.

- Simple shaft design
- Very fast and simple installation and removal
- Suitable crosslinks have to be provided between the side profiles to reinforce the conveyor.

- With driven rollers, play between the shaft and the mounting hole (inevitably due to oblique installation) will create noise, particularly when starting and stopping the turning motion (especially at hex shafts).
- Depending on the selection of material pairing (shaft/side profile) and dimensions (size of hole and spring-loaded shaft), it may lead to wear of the shaft (hexagon loses its edges) or the side profile.
- Shield for zinc-plated shaft material is not zinc-plated

Female threaded shaft

Female threaded shafts can be manufactured from round material or hex material.

- Lead to a very stable frame construction – generally, no use of crosslinks is required
- A firm connection causes a lot less noise than shafts that are not firmly screwed together.
- The roller shaft and side profile stabilize each other resulting in the conveyor rollers having a greater load capacity than loosely fitted rollers.
- Wear-free towards spring-loaded shafts due to firm connection in the side profile
- Medium-fast installation and removal
- Shield for zinc-plated shaft material not zinc-plated
- Safe discharge of static charges (anti-static design)

Interroll offers the following threads and thread depths:

Thread	Thread depths [mm]
M5	12
M6	15
M8	15
M10	20
M12	20, 25
M16	25

Shaft with shaft-shuttle

Shafts with shaft-shuttle are made of 8-mm hex material. Both ends are fitted with the shaft-shuttle made of polyamide. The conical shaft-shuttle reduces the hex surface towards the shaft end.

- Very fast and simple installation and removal
- Similar low noise level as female threaded shafts
- Wear-free towards spring-loaded shafts due to zero-clearance seating of the shaft free in the side profile (11 mm hex hole, +0.3/+0.8 mm)
- Anti-static version
- Particularly suited for modernizing systems; side profiles that have been in use for a long time generally show high tolerances in the holes
- Evenly aligned, anti-rotation shuttles (positioning one side is sufficient)
- Both shaft ends can be pushed in
- Suitable crosslinks have to be provided between the side profiles to reinforce the conveyor
- No scratching of high-quality side profiles during installation and removal

Male threaded shaft

Male threaded shafts are made of round material.

Male threaded shafts feature a thread cut onto the shaft ends. In each case, a nut is screwed onto the shaft in front of the seal. The two nuts are subtracted from the dimension of the "lane width" during the production of the roller. They shorten the usable length of the roller compared to rollers with female threaded shafts.

- A firm connection causes a lot less noise than shafts that are not screwed together
- Very stable frame construction – generally, no use of crosslinks is required
- The roller shaft and side profile stabilize each other resulting in the conveyor rollers having a greater load capacity than loosely fitted rollers.
- Wear-free towards spring-loaded shafts due to firm connection in the side profile
- The two nuts at the seal and two nuts with washers for fastening are part of the scope of delivery
- Available only in the versions uncoated steel or stainless steel

Flatted shaft

Flatted shafts are made of round material. They have two lateral, parallel milled sections at the shaft ends, which fit into corresponding side profile holes, e.g. into side profiles with open longitudinal holes.

- Very fast and simple installation and removal
- Suitable crosslinks have to be provided between the side profiles to reinforce the conveyor.
- Lower noise level than spring-loaded shafts since only minor play is required (no oblique installation)

GENERAL TECHNICAL INFORMATION

SHAFTS

A flat shaft can be created on both sides as well as on one side only (D shaft). The flat shaft can be defined in increments of 0.5 mm. Minimum and maximum dimensions depend on the selected shaft diameter.

Fixed shaft

Fixed shafts can be manufactured from hexagon or round material. It is possible to fit the round shafts with a flat shaft. The shafts are mostly inserted in fastening holes in the side profile that are open at the top. To rule out that the shaft turns inside the guide of the side profile, Interroll recommends the use of hexagon shafts or round flattened shafts in corresponding side profiles intended for this purpose.

- Shields, or flat shafts if needed, are not zinc-plated for zinc-plated shaft material.
- Simple shaft design
- Very fast and simple installation and removal with fastening holes open to the top
- Suitable crosslinks have to be provided between the side profiles to reinforce the conveyor
- With driven rollers, play between the shaft and the mounting hole will create noise, particularly when starting and stopping the turning motion. For this reason, Interroll recommends the lowest play possible.

Installation instructions

The following should be considered in relation to the selection of a shaft and construction of the side profiles:

1. The hole dimension of the side profile should be as small as possible on conveyor rollers with female threaded shafts. Larger holes can lead to a higher tolerance of the roller pitch and to the height differences of several conveyor rollers. The function of the roller conveyor can be affected by the hole and screw selection.
2. For softer side profiles made out of aluminum or thick powder coatings, female threaded shafts should always be selected with the largest possible diameter and the smallest possible thread. This minimizes the risk of the shaft penetrating the aluminum profile.
3. The installation of conveyor rollers with spring-loaded shaft must be done in an oblique way. That is the spring-loaded shaft must be inserted in a hole of the side profile. Afterwards, the other roller end is moved from an oblique to

a horizontal position. The spring-loaded shaft can be inserted into the hole on the opposite side only in the horizontal position. Too small a hole could make installation significantly more difficult.

The following formula and the drawings should provide support in sufficiently dimensioning the fastening hole. For this purpose, an oversize of 0.5 mm of d1 compared to the shaft diameter is sufficient in most cases. In case of side profiles with different heights, the dimension H of the higher profile must always be used for the calculation.

$$d1 = \frac{S \cdot (H + D/2)}{(EL - 1)} + d$$

GENERAL TECHNICAL INFORMATION

SHAFTS

Scope of delivery

Material required for fastening the rollers is not part of the scope of delivery, such as washers, nuts, screws.

Exceptions

Product	Scope of delivery
Rollers with male threaded shafts	Nuts and washers
Rollers of series 3500KXO light	Taper disks and ball sockets

Labeling

All shafts starting with a length of 100 mm are labeled with the respective production order number. The number is located on the shaft inside the tube. It allows users to order an identical roller without having to provide information about the product, such as the length.

Axial play

Conveyor rollers must not be warped during installation or operation. This means that play must exist between the seal of the roller and the side profile. The roller must move in axial direction under load.

The axial play must not be too high. Rollers with tapered shaft-shuttle or RollerDrive with tapered spring-loaded shaft are designed so that they have the best possible fit for the hole in the side profile, even in cases of high hole tolerances. This reduces wear and possible noise. If the axial play is too high, it may pose the risk of insufficient positioning of the hexagon in the hole, which leads to wear and noise.

The maximum play is already taken into account during the manufacture of the rollers.

Example: At the time of ordering, a lane width (EL = installation length) of 500 mm is specified for a roller of series 1700 with female threaded shaft. The dimension from seal to seal measures approx. 499 mm. Hence, the roller has an axial play of approx. 1 mm (see figure above).

The axial play under consideration depends on roller series and roller version. For example, an axial play of approx. 1 mm on the drive side and 0.5 mm on the other side is taken into account for a roller of series 3500 with sprocket head (see figure above).

The axial play stated is only a guide value. There may be slight deviations from this figure in individual cases when production tolerances are added. The function of a correctly installed and used conveyor roller is not being impacted.

Variable shaft length

A deviation of the standard shaft length is possible for all roller series. The shafts can be shortened or lengthened. The axial support of a roller via the seal must be ensured at all times. For some roller series, this requires taking appropriate measures in case of a shaft lengthening.

GENERAL TECHNICAL INFORMATION

TUBES

A length change is possible for the following shaft versions:

- Female threaded shaft
- Male threaded shaft
- Fixed shaft
- Spring-loaded shaft
- Flatted shaft

The length changes depend on the actual shaft version. Please direct any questions to your Interroll contact person. Axial support by the seal may no longer be guaranteed with a length change. With greater axial forces, e.g. where there is lateral displacement, suitable replacement structures, such as spacing tubes, may have to be fitted.

With female threaded shafts, the shaft can be lengthened only if the seal is given an axial support. Depending on the thread and shaft diameter, a retaining ring can be inserted. The retaining ring is secured via a groove incorporated in the shaft. The combination of a female threaded shaft with flatted shaft also requires a support of the seal.

In case of a shaft lengthening, the maximum load capacity of the roller is reduced compared to the values that are specified for each side.

Shaft adapter

The shaft adapter is a conductive polymer component that can be pressed onto roller shafts. It can be inserted in side profiles with open elongated holes. In this case, the roller is placed from the top. The shaft adapter significantly reduces the noise level compared to the pure steel shaft and increases the installation length of the roller. The shaft adapter is not an alternative to the tapered shaft-shuttle (page 13).

Technical data

Material	Polyoxymethylene, RAL9005 (jet black)
Temperature range	0 to + 40 °C
Suitable shafts	Fixed round shafts (∅ 8 and 10 mm)
Anti-static version	< 10 ⁶ Ω
Max. static load of a roller with the use of shaft adapters	See load capacity in the corresponding table (load capacity is not reduced by shaft adapter)

Design versions

Shaft diameter [mm]	Drawing	Longer installation length [mm]
8		+5
10		+4

- 1 Adapter 11 HEX (hexagon)
2 Adapter flat shaft 12

The shaft adapter can be used with the following roller series:

- Series 1100
- Series 1700
- Series 3500 (for drive heads for belts)

Tubes

Tube materials/tube diameters

Steel/stainless steel

The steel tubes used by Interroll are manufactured in accordance with DIN EN 10305-1, DIN EN 10305-3 and DIN EN 10296-2 but with stricter tolerance specifications.

The roller manufacturing and transport may result in minor scoring or scratches to appear on the tube surface. However, they do not have any effect on the functionality of the roller.

Benefits

- Highest resistance and bending stiffness
- Steel – corrosion protection through zinc-plating or carbonitriding
- Stainless steel – very good and long-life corrosion protection
- Stainless steel – Application also possible in aggressive environments (not suitable for seawater)
- Sprockets and flanges can be welded on (flanges not together with stainless steel tube)

- Steel tubes can be flanged over the bearing assembly so that the bearing housing can no longer move out (not for carbonitrided tube as well as tubes with a wall thickness greater than 1.5 mm)

Versions

- With grooves (not for carbonitrided tube)
- Covered with PVC or PU sleeve
- With lagging
- With pushed-on tapered elements
- With flanges welded on

When used in belt conveyors, there is noise caused by the pared tube welds coming into contact with the belt. Interroll recommends testing the relevant application.

Aluminum

Aluminum tubes have slightly lower strength and only about 33 % of the flexural strength of steel tubes. However, they weigh only 36 % of the weight of comparable steel tubes.

Benefits

- Significantly lighter than steel tube
- Corrosion-resistant
- Aluminum tubes can be flanged over the bearing assembly so that the bearing housing can no longer move out

Versions

- Covered with PVC or PU sleeve
- With pushed-on tapered elements

Ø Rollers [mm]	Anodized surface	Anti-static version
20	Yes	No
50	No	Yes

PVC

Benefits

- Noise-dampening
- Highly impact-resistant
- Very lightweight
- Corrosion-resistant, no surface treatment required
- Easy to clean

Polymer tubes have a significantly lower load capacity compared with steel and aluminum tubes with the same diameter.

With polymer tubes with a diameter of 30 mm and larger, the bearing assemblies are connected form-fit with the tube so that an absolutely safe seating is ensured.

An ambient temperature range from -5 to +40 °C applies to polymer tubes. With a high ambient temperature (from 30 °C) and high continuous static load (over hours), a permanent deformation of the rollers cannot be ruled out.

When dimensioning the rollers for an existing width between the side profiles (lane width), a thermal expansion must be taken into account. In case of large temperature differences, the length of the roller changes based on the following formula:

$$\Delta L T = \frac{0,08 \cdot L \cdot \Delta T}{1000}$$

- $\Delta L T$ = change in length due to temperature change (mm)
- ΔT = temperature difference (°C)
- L = tube length (mm)

A proper functioning requires that a warping of the roller at high temperature is being avoided.

Versions

- Covered with PVC or PU sleeve

Polymer tubes are available in the following colors:

Color	RAL number	Ø Tube [mm]
Stone gray	7030	16, 20, 30, 40, 50, 63
Graphite gray	7024	20
Sky blue	5015	50

GENERAL TECHNICAL INFORMATION

TUBES

Tube diameter

The following overview lists all available shell diameters and their wall thicknesses. The respective shell series chapter describes which diameter is available in which material.

Ø Tube [mm]	Wall thicknesses [mm]
16	1.0
20	1.5
30	1.2; 1.8
40	1.5; 2.3
50	1.5; 2.8; 3.0
51	2.0
60	1.5; 2.0; 3.0
63	3.0
80	2.0; 3.0
89	3.0

Finishing of shell materials

Material	Surface finishing
Steel	Zinc-plating
Steel	Carbonitriding
Aluminum	Anodizing

Zinc-plating

Galvanized zinc-plating of steel tubes is a cost-efficient corrosion protection.

Application

- For dry application areas with normal temperatures
- Conditional suitability for environments with salt and humidity, e. g. installations in harbor areas or in sub-tropical countries
- Conditional suitability in applications with moist or wet materials

Besides zinc-plated tubes, Interroll also offers zinc-plated shafts and zinc-plated sprocket heads. Front sides of shafts cannot be zinc-plated.

Procedure

The surface of the steel tube material is galvanically zinc-plated (using electrolysis). The electrolysis produces an extremely even, thin sleeve. The entire process involves pre-treatment, zinc-plating, passivating and drying.

Properties

Zinc-plated tubes are suitable for flanging and applying grooves. The galvanized zinc-plating is a temporary protection of the steel tube against corrosion.

The duration of the corrosion protection is reduced by the mechanical and thermal loads to which it is subjected. Particles of the zinc layer may be carried off when transporting materials over zinc-plated steel rollers.

Zinc-plated surfaces are sensitive to scratching and abrasion. Damage can result in point corrosion.

Extreme changes in temperature must be avoided as they can cause internal tension. Furthermore, corrosion resistance becomes reduced as the temperature rises.

In order to maintain the limited protective effects of zinc-plating, special packaging must be used for sea freight, for example.

Special measures must also be employed if the materials are to be stored for a longer period of time. Zinc-plating is not food-compatible.

A zinc-plated and passivated surface reacts with the following substances:

- Humidity
- Acidic environment (exhaust fumes, salts, wood acid etc.)
- Alkaline substances (lime, chalk, cleaning agents, CO₂)
- Perspiration
- Solutions of other metals (copper, iron etc.)

Layer thickness	6 to 15 µm
Passivation	Additional blue passivation (chromium(IV)-free)
Standards complied with	DIN EN ISO 2081 DIN 50961 Zinc-plating according to RoHS regulations
Temperature range	-40 to +200 °C
Antistatic	Yes

The long material is zinc-plated. When the tube is sawed off, the front sides are not zinc-plated.

Carbonitriding

Carbonitriding is a wear-resistant corrosion protection for steel tubes.

Application

- For highly stressed conveyor rollers, e.g. from the transport of steel containers
- For applications where materials must be transported axially on rollers

Procedure

Carbonitriding is a thermochemical process. For this purpose, the surface of the tube is enriched with nitrogen which creates a wear-resistant ceramic coating.

Properties

Carbonitrided tubes are partially suitable (up to 1.5 mm wall thickness) for flanging, but not for the application of grooves.

The ceramic coating is a temporary protection of the steel tube against corrosion. It is resistant to scratching and chafing. Mechanical damage can result in point corrosion.

In addition, carbonitriding distinguishes itself with the following properties:

- Abrasion-resistant surfaces
- Good sliding properties
- Excellent temperature resistance
- Low warpage
- Free of scales
- Good corrosion resistance

The ceramic coating is not food-compatible. The carbonitrided surface does not create any abrasion, but can leave color traces behind.

A carbonitrided surface can react with the following substances:

- Acidic environment (exhaust fumes, salts, wood acid etc.)
- Alkaline substances (lime, chalk, cleaning agents, CO₂)
- Perspiration
- Solutions of other metals (copper, iron etc.)

Tube color	Matt, light gray, and scale-free (no grinding necessary/possible)
Min. reference length	100 mm
Max. reference length	2000 mm
Temperature range	-40 to +80 °C
Antistatic	Yes

Carbonitriding is performed on the tube section that has already been cut to the correct length. This will also carbonitride the front sides.

Anodizing

Anodizing is a corrosion protection for aluminum tubes.

Application

- For weight-sensitive applications, e.g. shuttle systems
- For aluminum tubes with 20-mm diameter

Procedure

The surface of the aluminum tube is given an oxidic protective coating. Compared to galvanizing procedures, the top material layer is transformed and an oxide is formed.

Properties

The duration of the corrosion protection is reduced by the mechanical and thermal loads to which it is subjected. Particles may be carried off when transporting conveying goods over anodized rollers.

Anodized surfaces are low-sensitive to scratching and abrasion. Mechanical damage can result in point corrosion.

An anodized surface can react with solutions of other metals, such as copper, iron, etc.

Layer thickness	≥ 20 µm
Tube color	Aluminum color (natural)
Standards complied with	DIN EN 754/755
Temperature range	-40 to +80 °C
Antistatic	No

The rod material is anodized. When the tube is sawed off, the front sides are not anodized.

Comparison

The different finishings of steel tube have different resisting forces compared to mechanical wear. The following table provides a factor that shows the reduction in wear of the tube surface compared to the steel zinc-plated version.

Material/finishing	Factor
Zinc-plated steel	1
Stainless steel	5
Steel carbonitrided	120

A carbonitrided surface is 120 times as resistant as a zinc-plated surface.

GENERAL TECHNICAL INFORMATION

TUBES

Tubes with grooves

Grooves are running grooves that can be placed in steel tubes. They are used to guide round belts. When using the corresponding round belt, they are below the roller surface and, as such, do not contact the conveying good.

When the round belt is moved, the conveyor roller also moves. Two options are differentiated here:

- Wrap from roller to roller
- Wrap of a driven shaft that is positioned below the conveyor rollers. The guide rollers required for guiding the round belts on the drive shaft are located on Series 2600.

Grooves can be applied for the following roller and RollerDrive series:

Roller or RollerDrive series		Catalog page
Universal conveyor roller	1700	page 60
Universal conveyor roller	1700 heavy	page 74
Tapered universal conveyor roller	1700KXO	page 68
RollerDrive	EC5000	–

For tapered universal conveyor rollers, the tube must be longer than the tapered elements. The grooves are applied to this tube extension.

Please contact your Interroll contact person if grooves need to be applied to other roller series.

Rollers with grooves always contain an antistatic element. The maximum conveyor force of the round belt measures 300 N. The maximum load capacity per conveyor roller with groove measures 300 N due to the low conveyor force of the round belt.

The load capacity information in the individual roller series refers to rollers without grooves.

The maximum load capacity of the conveyor roller is lower with tube lengths of greater than 1400 mm. Interroll recommends a shaft version that is secured against twisting for round belt drives, such as a female threaded shaft. Grooves can be applied to tubes with a wall thickness of up to 2 mm.

It is possible to apply one to four grooves for each tube. The dimensions A and up to D, as needed, must be specified accordingly at the time of ordering. Version-dependent limitations of the groove positions are located in the respective chapters of the roller and RollerDrive series.

Grooves reduce the concentric precision and load capacity of conveyor rollers. A process-based enlargement of maximum 1 mm of the tube diameter is possible in the immediate vicinity of grooves. Interroll recommends conveyor rollers with round belt drive heads or PolyVee drive heads of the Series 3500 to ensure that concentric precision is adhered to (page 82).

Concentric precision

Conveyor rollers and RollerDrive are manufactured from tubes according to DIN standard. This standard allows deviations in form and straightness, which give rise to the concentric precision of the roller and RollerDrive, among other things.

Fig.: Measuring the concentric deviation

In principle, concentric deviation depends on the length and material of the tube. It is all the greater the longer a tube is, especially with PVC tubes. The concentric deviation and a possible diameter enlargement in the vicinity of the grooves must be observed when dimensioning the minimum roller pitch.

The average and maximum concentric deviation of the rollers can be found in the following diagram.

Concentric deviation of rollers with steel tube $\varnothing \leq 60$ mm

Concentric deviation of rollers with steel tube $\varnothing \leq 89$ mm

The concentric deviation described above as well as the diameter enlargement due to the integration of grooves result in a theoretical envelope diameter that is larger than the tube diameter. The following diagrams show the respective envelope diameter with respect to the roller length.

Envelope diameter of rollers with steel tube $\varnothing \leq 60$ mm

Envelope diameter of rollers with steel tube $\varnothing \leq 89$ mm

The envelope diameter depicted here only takes into account the tolerances of the rollers and RollerDrive. Tolerances from, for example, installation out of center or tolerances in the grid spacing of the fastening holes are not taken into account.

Rollers with PVC tube

With polymer tubes, the concentric deviation increases disproportionately to the length of the tube. The following lengths should not be exceeded:

GENERAL TECHNICAL INFORMATION

CHECKING THE CONCENTRIC DEVIATION

Ø Tube [mm]	Max. tube length [mm]
16	300
20	400
30	500
40/50	600
63	800

Please note that DIN-compliant tubes are permitted significantly higher concentric tolerances. For this reason, the average concentric deviations depicted in the diagrams can be exceeded in individual cases.

Checking the concentric deviation

In principle, the rollers manufactured by Interroll have a high concentric precision. The concentric precision is sufficient for almost all applications. On top of that, Interroll offers a 100% inspection for rollers made out of steel.

Inspected rollers

In the case of inspected rollers, the rollers with grooves are subject to 100% inspection. Interroll ensures that only rollers with an average concentric precision are shipped – see the chapter “Concentric precision” page 20.

The 100% inspection of grooved rollers is only possible for the following versions:

- Rollers with a diameter of 50 mm
- Rollers up to a length of RL = 1,400 mm
- Rollers with 1 or 2 grooves
- Shaft material: 11 mm hexagon or 8, 10, 12, 14 mm round shafts
- Shaft designs: fixed shafts, spring-loaded shafts or shafts with female thread

Straightened rollers

In the case of straightened rollers, the rollers are subject to 100% inspection. If the concentric deviation lies outside the average concentric deviation (see diagram page 21), the tube is straightened.

Straightening is possible for tubes with a wall thickness up to 2 mm and the following materials: Uncoated steel, zinc-plated steel, stainless steel, aluminum and anodized aluminum.

Straightening is possible for the following tubes or tube lengths:

Ø Tube [mm]	Tube wall thickness [mm]	Min. length [mm]	Max. length [mm]
16	1	300	1000
20	1.5	490	1200
30	1.2	400	1200
40	1.5	600	1700
50	1.5	800	2000
51	2	600	1500
60	1.5	1000	2000
80	2	1500	2000

Straightening is not possible for rollers with the following features:

- Rollers with grooves
- Rollers with flange
- Rollers with sleeve or lagging
- Rollers with tapered elements
- Carbonitrided rollers and PVC rollers

Roller lengths

The Interroll conveyor rollers can be manufactured in different lengths utilizing millimeter increments. Most versions can be manufactured starting at a length of approx. 200 mm. The longest dimension for many series is approx. 2000 mm. The shortest and longest dimension depends on many factors, such as shaft design, tube material, production process or packaging options.

Definitions

RL	= Reference length/ordering length
EL	= Installation length, inside diameter between side profiles
AGL	= Total length of shaft
U	= Usable tube length, length without bearing housing and for flanged metal tube without length of flanging

For conveyor rollers with female threaded shaft, the total shaft length corresponds to the installation length.

The installation length can be measured via the total shaft length only for rollers with female threaded shaft. For all other shaft designs, the installation length cannot be measured precisely at the conveyor roller. The axial play of approx. 0.5 mm or at the driven sides of approx. 1 mm is part of the installation length and does not allow an exact measurement of the installation length.

The reference length/ordering length has measurable reference edges on the conveyor roller for the following series:

- 1100
- 1700
- 1700 light (exception: Ø 20 mm)
- 3500 light
- 3500
- 3500 heavy
- 3800

PVC sleeve

The PVC sleeve ensures a particularly high noise reduction and offers a high level of protection for sensitive conveying goods. An improved conveyance of conveying goods is achieved with the higher coefficient of friction compared with a steel tube. Conveying goods can easily be separated since the larger diameter leads to a higher speed with the same rotational speed.

Technical data

General technical data	
Min. sleeve length	50 mm
Temperature range	-28 to 50 °C Risk of fracture when cold starting at -30 °C
Material	
Tube	Zinc-plated steel, stainless steel
PVC sleeve	<ul style="list-style-type: none"> • RAL7030 (stone gray) or RAL9005 (black) • Soft PVC, RAL7030 (stone gray) • Silicone-free • RoHS-compliant • REACH-compliant • Not food-safe • Non-conductive • Not oil or gasoline-resistant
Sleeve hardness	62 + 5 Shore A (at 20 °C); the hardness increases at lower temperatures

Tapered RollerDrive cannot be fitted with a PVC sleeve.

GENERAL TECHNICAL INFORMATION

PVC SLEEVE

Design versions

PVC sleeve, stone gray

Ø Tube [mm]	Sleeve material thickness [mm]	
30	2	5
40	2	5
50/51	2	5
60	2	5
80	2	

PVC sleeve, black

Ø Tube [mm]	Sleeve material thickness [mm]	
50/51	2	

The PVC sleeve is not glued onto the conveyor roller. The conveyor roller is pushed into the sleeve widened with compressed air by using a pressing machine. Then the sleeve is cut to the length of the tube or to the specified dimension.

Conveyor rollers with welded drive element can also be fitted with a PVC sleeve. This requires a drive element whose diameter is not greater than 12 mm of the tube.

Friction rollers (Series 3800, 3800 light, 3870) can be fitted only with 2-mm PVC sleeve. Rollers with PVC sleeve are always designed with an antistatic element. The PVC sleeve is not antistatic.

The sleeve is a wear part. For example, sharp-edged or heavy conveying goods with a structured bottom can wear out the tube more quickly. The tube is unsuitable for very sharp-edged or pointed conveying goods or pallets with protruding nails.

Dimensions

The PVC sleeve generally covers the entire tube length. It is possible not to fit sections of the roller with the PVC sleeve, e.g. the free space for grooves. A minimum length of 50 mm is required for a firm seating of the sleeve. With existing axial forces, a greater minimum length must be selected.

When ordering a roller or RollerDrive with sleeve, always specify the dimensions A to D.

Split PVC sleeve and PolyVee drive head

PVC sleeve with clean cuts

PVC sleeve and 2 grooves

PU sleeve

The PU sleeve ensures a high level of noise reduction, particularly for steel containers, and offers a high level of protection of sensitive conveying goods. An improved conveyance of conveying goods is achieved with the higher coefficient of friction compared with a steel tube. Conveying goods can easily be separated since the larger diameter leads to a higher speed with the same rotational speed. With mechanical stress, e.g. with abrasion, it offers a higher robustness than a PVC sleeve.

Technical data

Tapered rollers cannot be fitted with a PU sleeve.

General technical data	
Min. sleeve length	50 mm
Temperature range	-28 to +80 °C
Material	
Tube	Zinc-plated steel, stainless steel, aluminum
PU sleeve	<ul style="list-style-type: none"> • Polyurethane, RAL9005 (jet black), gloss • Softener-free • Silicone and halogen-free • FDA-compliant • RoHS-compliant • Non-conductive • Oil or gasoline-resistant
Sleeve hardness	75 + 5 Shore A (at 20 °C); the hardness increases at lower temperatures

Design versions

Ø Tube [mm]	Sleeve material thickness [mm]
50/51	2

With the lower elasticity, the PU sleeve cannot be applied to any other tube diameters or tubes with welded-on elements.

The PU sleeve is not glued onto the conveyor roller. The conveyor roller is pushed into the sleeve widened with compressed air by using a pressing machine. Then the sleeve is cut to the length of the tube or to the specified dimension. Rollers with PU sleeve are always designed with an antistatic element. The PU sleeve is not antistatic. Dusts can change the surface of the PU sleeve after some time, thereby reducing the coefficient of friction.

The sleeve is a wear part. For example, sharp-edged or heavy conveying goods with a structured bottom can wear out the tube more quickly. The tube is only suitable to some extent for very sharp-edged or pointed conveying goods or pallets with protruding nails.

Dimensions

The PU sleeve generally covers the entire tube length. It is possible not to fit sections of the roller with the PU sleeve, e.g. the free space for grooves. A minimum length of 50 mm is required for a firm seating of the sleeve. With existing axial forces, a greater minimum length must be selected.

When ordering a roller with sleeve, always specify the dimensions A to D.

Split PU sleeve and PolyVee drive head

GENERAL TECHNICAL INFORMATION

LAGGING

Lagging

The lagging ensures a high level of noise reduction and offers a high protection of medium-heavy to heavy conveying goods. An improved conveyance of conveying goods is achieved with the higher coefficient of friction compared with a steel tube. Conveying goods can easily be separated since the larger diameter leads to a higher speed with the same rotational speed. The lagging offers a high robustness under mechanical stress and is very abrasion-proof. Compared to sleeves, that are not connected to the tube, axial forces are also allowed.

Technical data

General technical data	
Max. reference length of the roller	1350 mm
Temperature range	-30 to 80 °C
Material	
Tube	<ul style="list-style-type: none"> • Uncoated steel (only for black lagging) • Stainless steel (for all lagging types)
Black lagging	<ul style="list-style-type: none"> • Nitrile rubber • Silicone- and halogen-free • Good resistance to alkalis • RoHS-compliant • Not FDA-compliant • Not antistatic • Oil, grease or gasoline-resistant • Not resistant to aromatics • Hardness 65 ± 5 Shore A
White or blue lagging	<ul style="list-style-type: none"> • Nitrile rubber • Silicone- and halogen-free • Good resistance to alkalis • RoHS-compliant • FDA-compliant • Not antistatic • Oil, grease or gasoline-resistant • Not resistant to aromatics • Hardness 70 ± 5 Shore A

Tapered RollerDrive cannot be fitted with a lagging.

Design versions

For tube diameters 40, 50, 51, 60, 80 and 89, a lagging of 2 to 5 mm thickness in increments of 0.1 mm is possible.

Roller series	Ø Tube [mm]	Bearing housing of drive side/non-drive side	Min. distance of lagging to left/right reference length [mm]
1450	80	Flanged/Flanged	15/15
1450	89	Flanged/Flanged	15/15
1700	40	Flanged/Flanged	16/16
1700	50	Flanged/Flanged	16/16
1700	50	Cylindrical/Cylindrical	6/6
1700	51	Flanged/Flanged	16/16
1700	51	Cylindrical/Cylindrical	6/6
1700	60	Flanged/Flanged	16/16
1700	80	Flanged/Flanged	16/16
1700 heavy	50	Flanged/Flanged	16/16
1700 heavy	51	Flanged/Flanged	16/16
1700 heavy	60	Flanged/Flanged	16/16
3500	40	Cylindrical/Flanged	0/16
3500	50	Flanged/Flanged	21/21
3500	50	Cylindrical/Flanged	6/16
3500	50	Cylindrical/Cylindrical	6/6
RollerDrive	50/51	Cylindrical/Flanged	6/21
RollerDrive	50/51	Cylindrical/Cylindrical	6/6

The lagging is applied through hot vulcanization and reground. This creates a high-strength joint of the lagging with the tube, resulting in a surface that is highly resistant to abrasion and very precise. For uncoated steel material, projecting tube sections are protected against corrosion with a black paint coating. For welded drive heads, the tube and drive head remain untreated.

Friction rollers (Series 3800, 3800 light, 3870) can be fitted only with 2-mm lagging.

GENERAL TECHNICAL INFORMATION

FLANGES

Dimensions

Stainless steel tube with 2 grooves and split lagging

Uncoated steel tube with 1/2" polymer double sprocket head with 14 teeth and lagging

Flanges

Flanges guide materials and prevent their lateral wandering. Circumferential welds ensure a high stability.

Technical data

The number of flanges and the roller pitch has to be selected in such a way that at least two flanges always guide the material at any given time.

Max. reference length	1600 mm
Material	Zinc-plated steel, uncoated steel
Max. number of flanges/rollers	4

Antistatic element

The antistatic element creates a permanent electrical connection between the metal tube and the shaft of the roller. If the side profile is grounded accordingly and an electrical connection is established between the shaft of the roller and the side profile, no static charge is created on the metal tube surface.

The antistatic element can be applied for the following tube materials or tube finishings:

Material	Surface finishing
Steel	None
Steel	Zinc-plating
Steel	Carbonitriding
Stainless steel	None
Aluminum	None (no anodic oxide layer)

By default, the antistatic element is applied for all conveyor rollers with integrated groove, all polymer-based drive heads, tube sleeves, and tapered elements and can be selected as an option for the following roller series:

- Series 1100
- Series 1450
- Series 1700 light
- Series 1700
- Series 1700KXO
- Series 1700 heavy
- Series 3500
- Series 3500KXO light
- Series 3500KXO
- Series 3950

The antistatic element is available for the following roller diameters:

- 20 mm
- 30 mm
- 40 mm
- 50 mm
- 60 mm
- 80 mm
- 89 mm

Interroll recommends to ensure the electrical connection of the roller shaft to the side profile and to check the grounding potential on the roller surface before and after the use of the roller. Threaded shafts are best suited to establish a reliable electrical connection.

GENERAL TECHNICAL INFORMATION

TUBES WITH NOISE REDUCTION

Tubes with noise reduction

Benefits

- High noise reduction, particularly with steel containers
- Reduces the frequency level and resonance when the rollers hit the end stop

Technical data

Min. reference length for attenuation	250 mm
Max. reference length for attenuation*	2000 mm
Ø Tube	50 mm
Temperature range	-28 to +80 °C
Tube Materials	Uncoated steel, zinc-plated steel, stainless steel, aluminum

* The insulating material is inserted in the tube with a maximum length of 1,000 mm. This length is sufficient for noise reduction.

Design versions

The following series can be equipped with noise reduction:

- Series 1100
- Series 1200
- Series 1500
- Series 1700
- Series 1700 heavy
- Series 3500

Rollers with noise reduction are fitted with a foam inner tube. The foam is pressed into the tube during the production process of the roller. The noise reduction is also possible for rollers with grooves.

GENERAL TECHNICAL INFORMATION TUBES WITH NOISE REDUCTION

ROLLERS

SERIES 1100

Gravity conveyor roller

Application area

Internal conveyor systems, particularly suited for cost-efficient implementation of gravity or push conveyors. Can also be used in the food processing sector. The grease used in the bearings is FDA-compliant.

High corrosion resistance

The rollers consist of stainless material. Upon request, it is also possible to use stainless steel balls.

Resistant to contamination

The smooth surfaces protect against dirt accumulation.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side.

Robust construction

For axial fixation of the bearing housing, the bearing assemblies for PVC tubes starting at a diameter of 30 mm are secured with an internal press-in edge in addition to the press fit.

ROLLERS

SERIES 1200

Steel conveyor roller

Application area

Driven unit handling conveying, such as transport of cardboards, containers, barrels or tires. Suitable for implementing gravity or push conveyors. The roller is designed for use in a very broad temperature range from -28 to $+80$ °C. The version with steel bearing housing is designed for use in deep freeze applications or applications with very high ambient temperature.

High reliability

The solid steel roller distinguishes itself with distinct longevity and high resilience, thanks to pressed and zinc-plated bearing shells with hardened running grooves.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Particularly robust

The shape of the ball bearings used is optimized for use in conveyor rollers so that large bearing deflections are possible.

ROLLERS

SERIES 1200

Steel conveyor roller

ROLLERS

SERIES 1450

Heavy-duty universal conveyor roller

Application area

Driven and particularly non-driven conveying systems, such as transport of cardboards, containers, barrels, wheels, pallets or steel containers. Thanks to a carrying capacity of up to 5,000 N, the product can be used as universal conveyor roller for very high loads. The roller series can also be used for the implementation of gravity roller conveyors. The version with steel bearing housing is designed for use in deep freeze applications or applications with very high ambient temperature.

Low-noise

The use of precision ball bearings, Technopolymer bearing housings and seals result in very quiet running.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side.

Axial loading capacity

Forces acting in axial direction are removed through ball bearings and seals.

Robust construction

To obtain an axial fixing of bearing housing, ball bearing and seal against escaping, the bearing housing is not only pressed into the tube, but also flanged.

ROLLERS SERIES 1450

Heavy-duty universal conveyor roller

ROLLERS

SERIES 1500/1520

Slide bearing conveyor roller

Application area

Non-driven container conveyor systems where the roller is generally used for conveying packaged or unpackaged food products. Since high levels of cleanliness requirements are met, the roller can be used in moist areas and a wet cleaning can be performed.

Long service life

Smooth-running, wear-resistant slide bearings, which do not allow any grease to be washed out, are installed in series 1500. In addition, the use of shaft pins made of stainless steel ensures a high corrosion resistance. Pressed-in bearing housings prevent foreign bodies from penetrating into the inside of the roller.

Easy cleaning

Contaminations can be removed with commercial cleaning agents. For particular thorough cleaning, the roller can easily be removed and reinstalled.

Simple installation

Slide bearing bushings allow engaging in a side profile with a maximum wall thickness of 2.5 mm and hexagon holes (does not apply to series 1520).

Robust construction

For axial fixation of the bearing housing, the bearing assemblies for PVC tubes are secured with an internal press-in edge in addition to the press fit.

Load capacities of series 1520 with shaft pin

The load capacity table refers to a temperature range from -5 to $+20$ °C for PVC tubes and to a temperature range from -28 to $+40$ °C for steel tubes.

Valid for the following shaft designs: Shaft pin with female thread.

Bearing: slide bearing.

Tube material	Ø Tube/thickness [mm]	Ø Shaft pin [mm]	Maximum static load [N] for installation length [mm]							
			200	300	400	600	800	1000	1300	1600
PVC	50 x 2.8	12	500	250	150	65	36	–	–	–
Steel	50 x 1.5	12	1100	1100	1100	1100	1100	1100	650	400

Removal of a roller of series 1500

A roller of series 1500 can easily be installed in hexagon holes using the supplied slide bearing bushings. If the roller must be removed again, e.g. for cleaning, it is just as easy. Interroll recommends a 12-mm open-end wrench for the removal. The open-end wrench must be placed between the inside of the side profile and the bearing housing of the roller. It must be placed on the hexagon so that the two bracket joints of the slide bearing bushing no longer project. The bracket joints prevent the slide bearing bushings from inadvertently dropping out of the side profile. If the bracket joints are placed by the open-end wrench, the slide bearing bushing can easily be pulled out to the outside.

ROLLERS

SERIES 1500/1520

Slide bearing conveyor roller

Dimensions of series 1500

A sufficient axial play is already taken into account, so that the actual lane width between side profiles is required. Ordering dimensions for tube sleeves, e.g. PVC sleeves, see page 24.

- RL = Reference length/ordering length
- EL = Installation length, inside diameter between side profiles
- U = Usable tube length, length without bearing housing and for flanged metal tube without length of flanging

ROLLERS

SERIES 1500/1520

Slide bearing conveyor roller

ROLLERS

SERIES 1700 LIGHT

Universal conveyor roller

Application area

Internal transport of small materials as well as use for assembly machines or packaging machines. Suitable for implementing gravity roller conveyors.

Low-noise

The use of precision ball bearings, Technopolymer bearing housings and seals result in very quiet running.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Small roller pitches

Small roller pitches can be implemented by using rollers with a diameter of 20 or 30 mm.

Robust construction

To achieve a high axial load capacity, particularly of bearing housings, ball bearings and seal, the bearing housing is not only pressed into the tube for the versions with metal tube, but also flanged. The bearing assemblies of the PVC tubes with a diameter of 30 mm are secured not only with a press fit, but also with an internal press-in edge.

ROLLERS

SERIES 1700

Universal conveyor roller

Application area

Driven and non-driven conveying systems, such as transport of cardboards, containers, barrels, or wheels. Suitable for implementing gravity or push conveyors. Also usable as belt bearing roller (no deflection).

Highest reliability

This roller series has been proven millions of times. The roller offers a very high degree of functional dependability.

Low-noise

The use of precision ball bearings, Technopolymer bearing housings and seals result in very quiet running.

Good protection against dirt and water

The roller excels with a good protection against coarse dirt and dripping water. An integrated groove ensures that water can be rejected.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Extremely soft starting

If an oiled precision ball bearing is used, the roller will start particularly easily.

Robust construction

To achieve a high axial load capacity, particularly of bearing housings, ball bearings and seal, the bearing housing is not only pressed into the tube for the versions with metal tube, but also flanged. The bearing assemblies of the PVC tubes are secured not only with a press fit, but also with an internal press-in edge.

Detailed product specifications are available on request.

ROLLERS

SERIES 1700KXO

Tapered universal conveyor roller

Application area

Driven unit handling conveying in the curve section, e.g. of cardboards, containers or tires. Suitable for implementing gravity or driven roller curves. Tight curve radii are possible if tapered elements with a conicity of 2.2° are used.

High reliability

This roller series has been proven millions of times. Contrary to conventional curve rollers, the elements are secured against shifting. This allows the roller to offer a very high degree of functional dependability.

Low-noise

The use of precision ball bearings, Technopolymer bearing housings and seals result in very quiet running.

Good protection against dirt and water

The roller excels with a good protection against coarse dirt and dripping water. An integrated groove ensures that water can be rejected.

Good running properties

The tapered elements made of polypropylene distinguish themselves with a low net weight so that good startup properties can be achieved.

Robust construction

Robust tapered elements are abrasion-proof, noise-reducing, impact-resistant and excel through a high weather-resistance.

Bearing version	Precision steel ball bearing 6002 2RZ, precision stainless steel ball bearing 6002 2RZ, bearing play each C3		

An antistatic element is always present in the tube of a roller with tapered elements.

To prevent any damages from static charging or discharging, Interroll recommends the use of black tapered elements.

ROLLERS

SERIES 1700 HEAVY

Universal conveyor roller

Application area

Driven unit handling conveying and particularly driven conveyor systems, transport of medium-heavy to heavy materials, e.g. cardboards, containers, barrels, pallets or rims. Suitable for implementing gravity or gravity roller conveyors. Also usable for mechanical engineering applications. The version with steel tube and dimension 60 x 3 mm can also be used as belt idler.

Highest reliability

This roller series has been proven millions of times. The roller offers a very high degree of functional dependability.

Low-noise

The use of precision ball bearings, Technopolymer bearing housings and seals result in very quiet running.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Robust construction

To obtain an axial fixing of bearing housing, ball bearing and seal against escaping, the bearing housing is not only pressed into the tube, but also flanged.

ROLLERS

SERIES 3500 LIGHT

Fixed drive conveyor roller

Application area

Driven unit handling conveying, transport of cardboards or containers with small dimensions. Suitable in the packaging industry, in assembly machines or for implementing machine chains.

Flexible design

The product is available in numerous chain drive versions. This allows implementing wrapping and tangential chain drives.

High-quality bearing

Sealed precision ball bearings of type 689 2Z are used.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Small roller pitches

Small roller pitches can be implemented by using rollers with a diameter of 30 mm.

ROLLERS

SERIES 3500

Fixed drive conveyor roller

Application area

Driven unit handling conveying, such as transport of cardboards, containers, barrels or tires.

Low-noise

The use of polyamide drive heads results in very quiet running.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

Robust construction

An axial fixation of the bearing assembly (bearing housing, ball bearing, seal) on the non-drive side can be accomplished in several ways. For the design with steel tube, the bearing assembly is pressed into the tube and then flanged. For the design with PVC tube, it is fitted with a groove inside the tube in which the press-in edge of the bearing housing engages. For the designs with PolyVee and round belt, the drive bearing assembly is also pressed into the tube and then flanged.

Modular construction

With a permanently installed bearing housing for a tube diameter of 50 and 60 mm, insertable polyamide drive heads, such as sprocket, toothed belt and flat belt heads, are interchangeable and can also be exchanged with friction heads. Numerous drive versions are available with flat, PolyVee, round or toothed belts as well as chains.

• Round belt drive head

With the round belt drive head, the drive section is separated from the conveying section, so that conveying goods cannot be shifted due to batching belts. Since the drive head has a higher friction because of grooves in the metal tube, the result is a higher conveyance of the round belts. If the round belts should slip because of the application, then the wear of the belts on a round belt drive head is higher.

• PolyVee drive head

The nine grooves of the drive head allow the use of 2-rib, 3-rib or 4-rib PolyVee belts. Compared with a round belt, the use of a 2-rib belt allows transferring approximately twice the torque.

ROLLERS SERIES 3500

Fixed drive conveyor roller

Dimensions

A sufficient axial play is already taken into account, so that the actual lane width between side profiles is required. The dimensions of the conveyor roller depend on the shaft version and the drive element.

Ordering dimensions for tube sleeves, e.g. PVC sleeves, see page 24, and for flanges see page 27.

- RL = Reference length/ordering length
- EL = Installation length, inside diameter between side profiles
- AGL = Total length of shaft
- U = Usable tube length: Length without bearing housing and for flanged metal tube without length of flanging

Can be combined with the EC5000 $\varnothing 60$ mm and steel double sprocket head

ROLLERS

SERIES 3500KXO LIGHT

Fixed drive curve roller

Application area

Driven unit handling conveying, such as transport of small cardboards or containers. Suitable for implementing driven roller curves in the packaging industry and for assembly machines as well as for implementing machine chains.

Good starting properties

Since the tapered elements are made of polypropylene, the net weight is low.

Tight curve radii

Using elements with a conicity of 1.8° allows implementing curve radii of only 357 mm.

Robust construction

Robust tapered elements are abrasion-proof, noise-reducing, impact-resistant and excel through a high weather-resistance.

Additional components in the scope of delivery

The rollers are delivered with four taper disks and two ball sockets so that an angle compensation can be created during fastening.

Technical data

General technical data	
Platform	1700
Max. load capacity	150 N
Max. conveyor speed	0.8 m/s
Anti-static version	No
Temperature range	-5 to +40 °C with greased ball bearing
Material	
Tube	Zinc-plated steel, stainless steel, aluminum
Shaft	Uncoated steel, zinc-plated steel, stainless steel
Tapered cones	Polypropylene, RAL9005 (jet black)
Bearing housing	Polyamide, RAL9005 (jet black)
Seal	Polypropylene, RAL1021 (rape yellow)
End cover	Cover from round belt guides; starting at a reference length of 300 mm, the round belt guides no longer cover the tapered element in its entirety
Drive head	Polyamide RAL 9005 (jet black)
Bearing version	Precision steel ball bearing 689 2Z, bearing play C0

An antistatic element is always present in the tube of a roller with tapered elements.

Design versions

Shaft: Ø 8 mm with M6 x 15 female thread

Reference length with tapered elements with round belt guides

Reference length [mm]	150	200	250	300	350	400	450	500	550	600
Min. Ø [mm]	23.4	23.4	23.4	23.4	23.4	23.4	23.4	23.4	23.4	23.4
Max. Ø [mm]	31.4	34.5	37.7	40.8	43.9	47.1	50.2	53.4	56.5	59.6

The specified minimum diameters refer to the smallest diameter of the first tapered element. Other lengths except the listed reference lengths are not available. A tube projection is not possible.

			600	578	23.4	59.7

ROLLERS

SERIES 3500KXO

Fixed drive curve roller

Application area

Driven unit handling conveying in the curve section, e.g. of cardboards, containers or tires. Suitable for implementing gravity or driven roller curves. Tight curve radii are possible if tapered elements with a conicity of 2.2° are used.

High reliability

This roller series has been proven millions of times. Contrary to conventional curve rollers, the elements are secured against shifting. This allows the roller to offer a very high degree of functional dependability.

Low-noise

The use of polyamide drive heads results in very quiet running.

Good running properties

The tapered elements made of polypropylene distinguish themselves with a low net weight so that good startup properties can be achieved.

Robust construction

Robust tapered elements are abrasion-proof, noise-reducing, impact-resistant and excel through a high weather-resistance.

Variants

Depending on the requirement, the curve rollers can be supplied with drive heads for PolyVee belts, round belts or chains.

• Round belt drive head

With the round belt head, the drive section is separated from the conveying section, so that conveying goods cannot be shifted due to batching belts. Since the drive head has a higher friction because of grooves in the metal tube, the result is a higher conveyance of the round belts. If the round belts should slip because of the application, then the wear of the belts on a round belt drive head is higher.

• PolyVee drive head

Compared with a round belt, the use of a 2-rib belt allows transferring approximately twice the torque. Conveying and drive technology are physically separated. A groove must remain clear between two belts so that the belts cannot touch.

ROLLERS

SERIES 3500 HEAVY

Fixed drive conveyor roller

Application area

Particularly suited for driven transport of heavy materials that require a small roller pitch, such as pallets and steel containers.

Very robust design

Welded steel sprockets and steel tube with a dimension of 60 x 3 mm enable reaching a high mechanical stability of the conveyor roller. To achieve a high axial load capacity, the bearing housing opposite of the drive side is not only pressed into the tube, but also flanged.

High load capacity

A stable, continuous female threaded shaft with \varnothing 17 mm ensures a high degree of reinforcement of the conveyor. Reinforced precision ball bearings of type 6003 are used. A corresponding small roller pitch is possible for the transport of very heavy goods.

High corrosion protection

After the welding process, the components consisting of tube, sprockets and flanges are individually zinc-plated, thereby achieving a high corrosion protection.

Lateral loading

The tube ends opposite the drive side are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

ROLLERS

SERIES 3800 LIGHT

Friction conveyor roller
Double friction conveyor roller

Application area

Transporting and accumulating unit handling conveyor systems, such as lightweight cardboards and containers. Also suitable for implementing buffer sections and for use in the packaging industry.

Numerous drive types

Various drive variants are available. The rollers can optionally be driven with flat or round belts as well as chains with a pitch of 3/8". Wrapping or tangential chain drive is possible.

Low-noise

The flat belt drive head made of polyamide ensures very quiet running.

Low roller pitches

Small roller pitches for transporting small materials can also be implemented.

Weight-dependent

Conveyance as well as accumulation pressure depend on the weight of the materials.

Two-sided friction coupling

For the double friction roller variant, the two-sided friction couplings are connected with each other by an internal tube. Positioning materials of different widths to the friction side are not required in this case.

Note: Please read the additional important information about the use of the friction roller in the planning section, Friction rollers.

ROLLERS

SERIES 3800

Friction conveyor roller

Application area

Transporting and accumulating unit handling, such as cardboards or containers. Also suitable for implementing buffer sections.

Modular construction

The friction heads are interchangeable and can also be exchanged with fixed friction heads. A permanently pressed bearing housing allows inserting a variety of drive heads. The friction heads made of polyamide are secured against dropping out.

Low-noise

The use of polyamide or polyoxymethylene drive heads results in very quiet running.

Numerous drive types

Numerous drive types are available. Depending on the requirement profile, the rollers can be driven with flat, PolyVee or toothed belts as well as chains with a pitch of 1/2" or 3/8".

Weight-dependent

Conveyance as well as accumulation pressure depend on the weight of the materials.

Note: Please read the additional important information about the use of the friction roller in the planning section, Friction rollers.

Friction conveyor roller

ROLLERS

SERIES 3870

Double friction conveyor roller

Application area

Transporting and accumulating unit handling, such as cardboards or containers. Also suitable for implementing buffer sections.

Two-sided friction coupling

It is a double friction roller whose two-side friction couplings are connected with each other by an internal tube. Positioning materials of different widths to the friction side are not required in this case.

Robust construction

The drive heads are pressed together with the internal tube which secures them against dropping out.

Numerous drive variants

A toothed belt drive head and sprockets with different number of teeth are available so that wrapping and tangential chain drive can be implemented.

Note: Please read the additional important information about the use of the friction roller in the planning section, Friction rollers.

ROLLERS

SERIES 3950

Heavy-duty conveyor roller

Application area

Driven unit handling conveying of heavy materials, such as transport of containers, barrels, wheels, pallets or steel containers.

Robust construction

Fixed drive conveyor roller with a particularly stable, robust construction. The sprockets are made of steel and are permanently welded.

Numerous drive types

Numerous sprocket heads are available. Chains from roller to roller or tangential chain drives can optionally be used.

Lateral loading

The tube ends are rounded, thereby allowing materials to be easily moved on from the side. Axial forces are removed through ball bearings and seals.

ROLLERS

SERIES MSC 50

Magnetic speed controller

Application area

Perfectly suited for use in gravity conveyors, in end points at sorters and spiral conveyors.

Purely mechanical solution

The purely mechanical solution renders a cabling or control redundant.

Maintenance and wear-free brake function

The contact-free eddy current brake operates maintenance and wear-free. It features the same high service life like a standard conveyor roller.

Soft startup

The gearless construction enables a softer startup which is already suitable for materials starting at 500 grams.

High braking power

Materials up to 35 kg can be decelerated. The tube diameter of 51 mm provides the necessary higher surface to rollers with a 50-mm tube diameter given the same fastening height and allows optimal braking.

Easy installation

The fastening holes of the conveyor rollers can be used so that no fastening holders with additional profile holes have to be used. The direction-independent function rules out assembly errors.

No impact on sensitive materials

No emissions to the outside are being generated, such as magnetism, which allows conveying even sensitive materials, such as electronic components.

Conveyance with ease of smooth containers

The design with PU sleeve also decelerates critical materials in a reliable way.

CONVEYOR ACCESSORIES

SERIES 2160

Polymer conveyor wheel

Application area

This series is universally applicable. It can be used, e.g. as side guide wheel. With the variant with stainless steel balls, it can also be used in moist areas.

Quiet, light and robust

The material selected is a particularly impact-resistant polymer. The wheel is very light and offers a very soft startup. The polymer ball race enables a very low noise level.

CONVEYOR ACCESSORIES

CONVEYOR ACCESSORIES

SERIES 2200

Steel conveyor wheel

Application area

This series is universally applicable, can be used in deep freeze areas and as side guide wheel.

Stable running and long service life

The steel conveyor wheel excels with its high load capacity, robustness at high and low temperatures as well as good running stability. Hardened ball running surfaces ensure a long service life.

CONVEYOR ACCESSORIES

SERIES 2370

Polymer conveyor wheel

Application area

The product is universally applicable and particularly suited for conveyor sections in which no continuous roller can be used. Among other things, it is used with packaging machines and in mechanical engineering, e.g. for transporting workpiece carriers or containers that allow a lateral guide.

Easy installation

The conveyor wheel is fixed via a floating fastening at the profile and can be installed with ease. A 2-mm large slot for placing the screwdriver is available.

Low operating noise

The wheel ensures low-noise running.

Robust construction

The wheel is made of impact-resistant polymer and features a double ball race.

CONVEYOR ACCESSORIES

SERIES 2500

Omniwheel

Application area

Crossings and switches can easily be implemented with the direction-independent turnability. Driven and non-driven conveyor segments, e.g. packing tables, assembly tables and feeds to processing machines. Particularly suited for softer materials such as cardboards.

Easy installation and use

Easy installation on round and hexagon shaft. With low mass and easy running gray wheels, the omniwheel can easily be moved in all directions. Several omniwheels can be coupled with one another. Corrosion-proof due to the use of stainless steel pins. Drive in one direction when used with a hexagon shaft.

Technical data

CONVEYOR ACCESSORIES

SERIES 2600

Pressure roller

Application area

Suitable for use with conveyors that are driven via flat belts or drive shaft. As belt pressure wheel suitable for flat belts with 20 to 30 mm width. When used on a drive shaft, the round belt guide wheel takes on the function of a friction shaft. A floating fastening on the profile is used.

Solid installation

The support of both ball bearings is accomplished with a space tube and allows a firm screw connection.

Good running properties

Precision ball bearings of type 6000 2Z and type 688 2Z are used.

Rust-free variant

For use under moist ambient conditions, a version made of stainless steel is available as an alternative. The slide bearings for the round belt guide wheels consist of polyamide.

Reliable belt guides

The running surfaces for the belts feature a spherical shape. It allows the belt to self-center in the guides.

Omnimat module

Application area

Crossings and switches can easily be implemented with the direction-independent turnability. Use as non-driven wheel conveyors for packing tables, assembly tables and feed to processing machines. Particularly suited for softer materials such as cardboards.

Product benefits

- Conveyance possible in every direction
- Corrosion-proof due to the use of stainless steel pins.
- Lateral dove tail profiles for fixed and form-fit connection; floor fastening with screw holes
- Flexible adaptability and expandability
- Different modules can be combined
- Closed version can be applied as spacer

CONVEYOR ACCESSORIES

SERIES 5000

Steel ball transfer unit

Application area

Alignment of medium-heavy and heavy materials, such as plates or containers with a smooth bottom. For pushing, e.g. steel or wooden plates. Suitable for applications that require an upside-down installation.

Direction-independent operation

The use of balls allows transporting the material in every direction. Crossings and switches can also be implemented easily. In addition, particularly soft running balls are being used.

Good protection against dust and splashing water

For variants with steel balls, a felt seal keeps out dust and splashing water. Variants with balls in stainless steel design also feature a long corrosion resistance.

Secure support

During operation, support balls circulate under the main ball. This accomplishes a constant and optimal support of the material.

CONVEYOR ACCESSORIES

SERIES 5500

Polymer ball transfer unit

Application area

The roller is used for aligning medium-heavy materials, e.g. plates, containers or cardboards with smooth bottom. Furthermore, the roller can be used for pushing, e.g. when transporting steel or wooden plates.

Direction-independent operation

The use of balls allows transporting the material in every direction. Crossings and switches can also be implemented easily. In addition, particularly soft running balls are being used.

Good protection against dust and humidity

For variants with steel balls, a felt seal keeps out dust. Design with main balls made of stainless steel or polymer also show a high corrosion resistance.

Suitable for sensitive materials

Variants with polymer balls are available for transporting goods with sensitive surfaces.

Secure support

The main ball rotates on support balls which turn on a ball socket. This accomplishes a good support of the material. The ball socket consists of stainless steel in all variants.

FLOWAY SERIES

Wheel track

Application area

The track is universally applicable and suitable for light materials. It can be used in gravity conveyors, pushing and also as side guide. They are generally used in order picking racks.

Secure guides

The track is designed so that it prevents an opening and jumping out of the wheels under load.

Robust construction

The continuous steel shaft guarantees high stability. The secure shaft support at the outer wings of the rail ensures that free-running of the wheels is also ensured under load.

Wheel track

Application area

The track is universally applicable and suitable for light and medium-heavy materials. It can be used in gravity conveyors, pushing and also as side guide. Different wheel pitches can be selected.

Medium-heavy materials to be conveyed

If medium-heavy goods have to be handled, the wheel track can be equipped with steel wheels.

Sensitive materials

To transport goods with critical surfaces, polymer wheels with covered rubber gasket can be used which minimize the risk of damages.

Good corrosion protection

The wheel track is made of zinc-plated steel.

Easy installation

The wheels can easily be inserted in the track with a snap-in function.

Roller track

Application area

The track is universally applicable and suitable for heavy materials. It can be used in gravity conveyors, pushing and also as side guide. Different roller pitches can be selected.

Heavy materials

The track can be designed with steel rollers if heavy materials have to be moved.

Sensitive materials

To transport goods with critical surfaces, polymer rollers can be used which minimize the risk of damages. Polymer rollers are also available in a flange design.

Robust construction

Robust rollers of series 1700 with a diameter of 50 mm are used in the track. The rollers are riveted in the profile.

Good corrosion protection

The roller track is made of zinc-plated steel.

Track with polymer rollers with flange

Track with steel rollers

ACCESSORIES

PolyVee belt

A PolyVee belt is used for the drive from roller to roller or RollerDrive for straight sections and for curves.

Product description

- Elastic standard belt, 1 to 3 % pretension, for fixed shaft distances
- Significantly longer service life than round belts
- Up to 300 % higher torque transmission than with comparable round belts
- Much better efficiency compared to toothed belts since much less flexing work is required
- Curve application: Use of 2-rib or 3-rib belts
- Suitable for normal and deep freeze temperatures
- Belts are antistatic

Material specification

Standards	ISO 9982 (DIN 7867) PJ profile for 2-rib and 3-rib V-ribbed belts (PolyVee)
Material	Complies with the Directive 2011/65/EC (RoHS) Contains only materials, which have been tested and registered to comply with the REACH Directive (EC No. 1907/2006) Silicone-free, PVC-free, flame-resistant
Electrical conductivity	< 7 MΩ (antistatic)
Temperature range	-30 to 80 °C
Dimensions	In accordance with ISO 9982 (DIN 7867), profile PJ
Color	Black

Please contact the relevant manufacturer for information on other drives.

PolyVee tensioning device

The PolyVee tensioning device enables easy tensioning of 2-rib and 3-rib PolyVee belts and is intended for roller pitches 75 mm and 100 mm. The tensioning device is designed for rollers and RollerDrive with a diameter of 50 mm. It cannot be used for tubes with tube sleeves or tapered elements.

The belt is perfectly tensioned and a roller/RollerDrive is correctly aligned horizontally as well as vertically. Hence, a female threaded shaft aligns with the fastening hole in the side profile.

Article number: S-1101272

Dimensions

PolyVee finger guard

The PolyVee finger guard safely protects against inadvertently reaching between PolyVee belt and roller drive head.

Product benefits

- Quick installation and removal, no screw connections required
- Fits into any side profile, the finger guard sits on the seal of the roller or on the fastening pin of the RollerDrive
- Installation in mechanically finished conveyor systems, can also be retrofitted in existing systems
- Always the right match, the rear panel is designed directly for two belts for quicker installation. The center of rear panel features a predetermined breaking point with which it can easily split in half in case of an uneven number of belts.

Technical data

- Temperature range: 0 to 40 °C
- Suitable tube diameter: 50 mm
- Color: Black
- Distance between side frame and seal of roller: min. 0.5 mm; max. 1.5 mm
- Roller pitch: 75 mm and 100 mm

Article number

- Roller pitch 75 mm: S-8863
- Roller pitch 100 mm: S-8864

Dimensions

PLANNING BASICS

CONVEYING GOOD

Conveying good

This chapter is intended to provide support in the planning of conveyor systems and the selection of matching products.

The properties of the conveying good, the requirements with regards the conveyor system and the ambient conditions are the basis for the planning of the system.

Length and width of conveying good

The length and width of the conveying good have an effect on several factors:

Straight running: The higher the ratio of length to width, the more stable will be the straight running of your items. With smaller length to width ratios, it may be necessary to put in place additional measures to stabilize the straight running of the conveying goods.

Reference length: As a rule, the reference length corresponds to the conveyor width +50 mm or for large conveying goods, such as pallets, +100 mm. In curves, Interroll recommends the use of tapered conveyor rollers and RollerDrive whose length must be calculated separately (see page 190).

Roller pitch: To transport the conveying good without problems, the roller pitch must be selected so that the conveying good is carried by three conveyor rollers at any given time.

Surface pressure: The different Interroll Conveyor Rollers and RollerDrive can be loaded with different forces. The static load capacity can be taken from the respective chapter. The values are based on the assumption that a conveying good rests on the complete usable tube length and not just on a part of it. If a conveying good has contact with less than approx. 50 % of the usable tube length, please have the application checked by Interroll beforehand.

Very long conveying goods generally do not rest on all conveyor rollers and RollerDrive that are located under them. If, for example, 20 conveyor rollers are under a piece of conveying good, but the conveying good contacts only 15 conveyor rollers, then the load capacity of a roller must be greater than one-fifteenth of the conveying good weight. For very long conveying goods, the tolerance of the roller fastening height for conveyor rollers and RollerDrive should be kept as low as possible so that as many conveyor rollers as possible can carry the conveying good.

Height of conveying good

The greater the height of the conveying good in relation to its bottom area, the higher is the risk of it tipping over when traveling on the conveyor. The following must be taken into consideration:

- Minimize the roller pitch as much as possible to ensure that the products are conveyed smoothly with as large a base surface as possible.
- Avoid rapid acceleration and harsh braking. Use MultiControl as far as possible for controlling EC5000. These control systems allow for purposeful matching of acceleration and deceleration of the RollerDrive.
- With inclined conveyor tracks, determine the center of gravity of the conveying good and check whether there is a risk of it tipping.

Weight and weight distribution of the conveying good

The weight of the conveying good must be distributed on a number of conveyor rollers so that the maximum load capacity of the individual conveyor roller and RollerDrive is not exceeded. This may mean that more than three conveyor rollers must support the conveying good.

In principle the weight of the conveying good should be distributed as evenly as possible. The more uneven the weight distribution is, the more difficult a reliable conveyance is.

If the weight of the goods is mostly at the front, then it is very likely that the rollers at the end of the load carrier support only very little weight. In the worst case scenario, the rollers at the start of the load carrier could be overloaded.

The load capacity increases with larger tube diameter. For heavy conveying goods, RollerDrive with a diameter of 60 mm should be used instead. The load capacity is increased by rollers with threaded shafts. In addition, the shafts reinforce the conveyor and act as a cross tie.

Drive elements, such as round belts or toothed belts, must also be selected while taking the conveying good weight into consideration. Interroll recommends PolyVee belts for conveying containers and cardboard cartons. Their service life and torque transmission is significantly higher compared to round belts.

Material of conveying good

The material, and especially the condition of the base, has an effect on the rolling and starting resistance.

Hard materials, such as polymer containers, feature lower rolling and starting resistances than soft materials, such as cardboard cartons. This has a direct impact on the required drive output and must be included in its calculation. The softer the underside of the conveying good, the higher is the drive output required for a product with the same weight but with a hard underside. In principle, the softer the conveying good, the smaller the roller pitch needs to be.

Ribs, keyways, strips or grooves in the bottom of conveying goods that run parallel to the direction of conveyance, do not pose a problem concerning transportability. The required drive output increases depending on their shape. Cross ribs can negatively impact the transporting. It may be necessary to determine the roller pitch empirically.

When checking whether a roller has sufficient load capacity for an application, it is important to take the condition of the conveying good into consideration. Conveying goods with an uneven bottom generally do not rest on all rollers that are located under them. With pallets, it must be ensured that only the rollers under the bulk of the pallet are actually bearing the load. The following diagram shows which runner load distribution occurs for an evenly loaded euro-pallet.

Fig.: Support of 2 runners

Fig.: Support of 3 runners

Conveyor requirements

The following fundamental parameters determine the configuration of the conveyor:

- Maximum throughput per time unit
- Geometry of conveying good
- Weight and weight distribution of the conveying good
- Control requirements
- Environmental conditions

The topic of environmental conditions is discussed below.

Static charging

In principle, conveyance via rollers creates electrostatic charging which, among other things, depends on the properties of the conveying good and the tube material.

To prevent electrostatic charging from occurring or dissipate it immediately and without creating sparks, Interroll offers antistatic versions for rollers with steel tube. RollerDrive feature an antistatic design in principle. Sleeves, lagging and gray tapered elements do not feature an antistatic design. For this reason, Interroll recommends the use of black tapered elements for curves.

Antistatic conveyor rollers and RollerDrive require the proper manufacturing and check of the conducting connection between shaft and side profile and the grounding of the side profile by the system manufacturer.

Noise level

Noise is created by different components of a conveyor and the conveying good itself.

Every drive creates noise. The RollerDrive is designed with decoupling elements which reduce the noise of the gear box. In most cases, the noise level of the RollerDrive is below 50 dBA. More and more zero-pressure accumulation conveyor systems are converted from pneumatic solutions with a centrally arranged drive to a RollerDrive solution. The significantly lower noise level is a deciding factor here.

The following applies to the noises of drive elements: A chain drive causes more noise than a belt drive. At high accelerations and decelerations, slipping round belts can cause squealing noises. Interroll recommends reducing the acceleration and deceleration of RollerDrive or using PolyVee belts. In this case, the risk of squealing noises is greatly minimized.

Very quiet rollers, RollerDrive and drive elements are of little use if the conveying good on the conveyor creates noise. Various measures can counteract it. The following should be observed in this case:

PLANNING BASICS

DRIVE CONCEPTS

- A small roller pitch generally causes less noise than a large roller pitch.
- Keep height tolerances at transitions from conveyors and at the fastening of rollers/RollerDrive as small as possible.
- Fitting the rollers/RollerDrive with noise-reducing materials, e.g. with a PVC or PU sleeve
- Use of noise reduction inside of rollers for rollers with a diameter of 50 mm.

Humidity

Humidity can occur in different forms as a result of the following:

- moist conveying goods, e.g. bottle crates stored in the rain
- moist environment, e.g. sculleries
- applications that become moist, e.g. because of cleaning or tripped sprinkler systems

If humidity can be expected in a system, then all components should be checked for corresponding resistance.

Interroll offers a series of products that are suitable for applications with humidity, water exposure, or water jets:

Tube material: Rollers and RollerDrive can be manufactured from rust-free material, such as stainless steel. In addition, materials can be protected with different finishing processes, such as zinc-plating.

Shaft material: Shafts for conveyor rollers can be manufactured from rust-free material, such as stainless steel.

Drives: The RollerDrive already has a high degree of protection with protection rating of IP54. If water jets can be expected in the application, Interroll recommends the design with protection rating IP66.

Bearing: All rollers with precision ball bearings are well protected against moisture and dust. For systems with constant humidity or moisture, Interroll offers designs with stainless steel ball bearings.

Applications in deep freeze area

Applications with an ambient temperature of approx. -28 °C are particularly prevalent in the food processing sector. Many items must be taken into account in the so-called deep freeze area:

- Changed starting torque of conveyor rollers and drives.
- Increased viscosity of greases, e.g. in ball bearings or gear boxes.
- Possibly frozen and, therefore, less flexible components, such as drive elements.
- Functional safety of all components through different contraction of various materials.

The solutions from Interroll

Materials: For various products, Interroll offers variants that are particularly suited for deep freeze applications. The tapered elements for conveyor rollers and RollerDrive are manufactured impact-resistant. Conventional materials used are often brittle and break easily. The bearing housings of series 1700 are designed as high impact-resistant for deep freeze applications.

Drive elements: Before using a drive element, its suitability for deep freeze applications should be checked. It should also be ensured that the friction at temperatures below zero is sufficient and the drive elements cannot freeze since frozen drive elements could pose unplanned torque requirements for the drive. The PolyVee belts offered by Interroll are suitable for deep freeze application (see page 178).

Bearing: The precision ball bearings used also work in deep freeze conditions. However, the startup of the roller is higher in this case than at an ambient temperature of 20 °C . RollerDrive are either designed for this higher startup, or oiled ball bearings are being used. The oiled bearings run significantly smoother at temperatures below zero.

Under deep freeze conditions, materials such as steel and polymer contract in different ways. For functional reliability, a PolyVee drive head for a RollerDrive is not only pressed into the steel tube, but it is also flanged. Additional security is provided by a metal star. This star, which is being produced with laser cutting, is engaged in the drive head and channels itself into the inside wall of the tube. This innovative solution inside the tube allows avoiding interfering edges on the outside contour of the tube. This solution is available as an option for various designs series 3500 and 3500KXO.

Drive concepts

With respect to drives, Interroll distinguishes between drives (such as round belts, PolyVee belts, chains, etc.) and the actual drive. Different drives are used in conveyor systems, such as drum motors, gear motors, motor rollers, etc. Furthermore, the potential energy of conveying good, e.g. on gravity conveyors, is also being utilized.

Gravity conveyors

A gravity conveyor differs significantly from the other concepts. It is not horizontally aligned, but always mounted at an incline. There are driven and non-driven gravity conveyors. Driven gravity conveyors can transport conveying goods upwards and downwards. These conveyors can be driven with RollerDrive. If the RollerDrive and, as such, the conveyor is stopped, the conveying goods remain in place and do not slide downward. The EC5000 holds its position with a certain torque which prevents any downward sliding. The different gear boxes and powers offer different zero motion holds. It must be ensured that

conveying goods do not slide over standing rollers; if necessary, friction must be increased, e.g. with the use of PVC or PU sleeve on rollers, RollerDrive and Stop Roller. Gravity conveyors use the potential energy of conveying goods. This means that other technology must first move the conveying good to a corresponding spatial height.

The conveying good rolls without additional drive as a result of the potential energy up to the end of the conveyor or up to the preceding conveying good. The speed and the restart capability of conveying goods is heavily influenced by:

- The incline of the conveyor
- The already existing speed of a conveying good when placed upon the gravity conveyor
- The ease of movement of the rollers
- The conveyor length
- The condition of the underside of a conveying good
- The weight of the conveying good
- Other properties

On the one hand, the conveying good must reach the end of the conveyor. It must not stop because its weight is too low to start moving rollers at rest. If many conveying goods are already on a gravity conveyor and, as a result, a piece of conveying good stops in the last section of the conveyor, then it must be ensured that the last item will start again and reach the end of the gravity conveyor after the first conveying goods have been conveyed.

On the other hand, the speed of the conveying goods must not be or get too high. There is the risk that a conveying good hits another jammed conveying good or the end stop at the end of the conveyor. This creates an injury risk for employees who may want to remove the conveying good by hand, as well as the risk of damaging the conveying good.

Establishing the matching properties of a gravity conveyor becomes a challenge if different conveying goods have to be moved. Generally, the conveying goods on a gravity conveyor differ by at least one of the following properties: Weight, size, material and base condition. A mixture of different conveying goods can also be transported by a gravity conveyor with respect to personnel and conveying good safety as well as process reliability. Interroll offers different products for this purpose. The rollers of series 1100 are designed for use in gravity conveyors.

The magnetic speed controller MSC 50 enables the restart of conveying goods starting at 0.5 kg and reliably decelerates conveying goods up to 35 kg depending on the properties of the conveyor. If conveying goods are lighter than 0.5 kg or heavier than 35 kg, it is also possible to use the RollerDrive series EC5000.

The driven RollerDrive ensures that every lightweight conveying good, regardless of its weight, can be moved or moved again. When decelerating heavy conveying goods, the energy recovered by the RollerDrive must not be too high. If one or several RollerDrive are used within a gravity conveyor, it also provides the advantage of accumulation pressure reduction. If a RollerDrive, which may be connected with additional rollers via drive elements, is stopped, then the conveying goods stop. This allows reducing the pressure on conveying goods that are already on the conveyor or on the stop at the end of the conveyor. On long gravity conveyors, it may be advisable to use several RollerDrive in order to reduce the accumulation pressure even further. If the incline is so high that conveying goods slide over the steel tube of a stopped RollerDrive, rollers or Stop Roller, then the friction may be increased with a PVC or PU sleeve on the tube.

In principle, it is recommended to test every gravity conveyor design under original conditions.

If drives are used in gravity conveyors, it must be ensured that they hold the conveying goods at standstill. But this is possible only if the drives are supplied with voltage. If the system voltage fails, all conveying goods will move downwards. This can be prevented with the Stop Roller that is designed for this application case. It is also connected to the system voltage and stops the conveying goods as soon as the voltage is lost. It is recommended to connect the Stop Roller, RollerDrive and rollers used via PolyVee belt. Due to dynamic braking torques, 3-rib or 4-rib PolyVee belts should be used.

Fixed drive conveyor

If a conveying good moves in harmony with the drive, then it is generally a fixed or constantly driven conveyor. The drive head of the rollers used is permanently connected with the tube. If the fixed drive heads are replaced with friction drive heads, they create a friction conveyor. Many different types of fixed drive conveyors are possible. They generally differ with respect to the selected drive element, such as chains, PolyVee belts, round belts, etc., and the drives used.

For all current fixed drive conveyors, Interroll offers matching conveyor rollers, with the RollerDrive EC5000, the Pallet Drive and PolyVee belt even drives and drive elements. When using a RollerDrive as drive, it is recommended to place it in the middle of the driven conveyor rollers (for information about the Pallet Drive, see the separate product documents). If many rollers have to be driven, then PolyVee belts offer advantages over round belts. The use of PolyVee belts reduces the number of roller revolutions with increasing distance to the RollerDrive.

PLANNING BASICS

DRIVE ELEMENTS

Friction conveyor

Friction conveyors are generally used to transport and accumulate materials. The special thing about friction conveyors is that an accumulation of materials can be accomplished with only little accumulation pressure when the drive is switched on. The same situation on a fixed drive conveyor would cause the materials that were stopped first to receive so much pressure from the subsequent materials that fragile cardboards could be damaged. Friction conveyors are well suited for buffer sections with non-uniform loading and unloading.

Friction conveyor rollers are available with many different drive elements, see page 187. Even a conveyor with drive shaft can be used as friction conveyor. The guide wheel of series 2600 enables not only guiding a round belt, but it also enables the drive shaft to turn while the wheel remains at rest. It must be ensured that the round belt does not slip through as this could significantly shorten its service life. For additional information, see page 187.

For some applications, it is a disadvantage if the materials touch, even if the accumulation pressure is reduced by the friction operation. In this case, a conveyor working at zero pressure accumulation may be better suited – see the next chapter (for additional information about friction conveyors, see page 187).

Zero pressure accumulation conveyor

The zero pressure accumulation conveying is often abbreviated as ZPA. A ZPA conveyor is generally divided into zones. The zone length is based on the length of the conveying good or the longest conveying good. Each zone features an option of identifying conveying goods, e.g. via a photo cell. In addition, every zone can be switched on and off. The zones are driven in different ways, see the examples below.

One option consists of a central drive, often a gear motor, that drives a flat belt. The flat belt is pressed onto the rollers using a switchable unit or guided past them. In the case of bypassing, the rollers are also often decelerated. It is feasible that the flat belt is pressed onto only a few rollers of a zone and the remaining rollers are connected with them by means of other drive elements. In many cases, this switching unit consists of pneumatic valves. They frequently cause an undesired noise level. A high level of energy can be expected for this ZPA solution since the powerful gear motor must also be powered if, for example, only one conveying good has to be moved on a 40-zone section.

Another option always presses the flat belt against a section of a roller in every zone. The remaining portion of the roller is switched in or out via a coupling. The remaining rollers of every zone are connected with the driven roller via other drive elements.

Another concept is the use of decentral drives. Motor rollers are often used for this purpose. In this case, drives which are directly driving the respective rollers, are installed in one or several rollers of a zone. A drive element connecting the entire conveyor is redundant. The remaining rollers of a zone are generally connected with the motor roller(s) using PolyVee or round belts. The zones can be activated or deactivated by purposefully switching the motor rollers on or off.

Depending on the length of the conveyor, the design with central drive usually falls below the investment costs of a solution with motor rollers. However, the operating costs tend to be higher due to the constant turning of the drive, even when nothing may be conveyed at the time. For most solutions with motor rollers, higher investment costs are possibly amortized after a short time.

Not only the lower energy consumption speaks in favor of a solution with motor rollers, but also the compact design. The motor is installed in a roller and does not have to be placed next to or below the conveyor.

Compared to gear motors, motor rollers are maintenance-free, they do not have to be greased and generally offer a higher safety level with a protected extra-low voltage.

But solutions with motor rollers can also have disadvantages. For solutions with many motor rollers per zone, the availability decreases – the more motors are being used, the higher the probability that a motor roller fails.

For this reason, Interroll recommends the use of the RollerDrive EC5000. In this case, one RollerDrive per zone is generally sufficient, and flexible control concepts are available. Furthermore, the controls offer many other options, such as change of direction of rotation or start and stop ramps which are not being offered by conventional ZPA conveyors.

Drive elements

With respect to drives, Interroll distinguishes between the actual drive, such as RollerDrive, drum motor, Pallet Drive, gear motor, etc. and the drive elements. Drive elements refers to different types of the torque transmission. Only the following drive elements are considered in this chapter:

- Toothed belt
- PolyVee belt
- Round belt

Chains

The chain is a tried and trusted method for driving conveyor rollers and conveyor elements in conveyor systems. Chains are characterized by their robustness and durability and are not

sensitive to dirt and environmental influences. Very high levels of power can be transmitted with a chain. It is recommended to protect the chain drive against inadvertent contact.

Chains are not maintenance-free and are relatively loud in operation. They must be lubricated regularly in order to achieve an optimum service life. The noise created by a chain as drive element increases with increasing speed. For this reason, speeds higher than 0.5 m/s are not recommended.

Conveyor rollers with flanges welded on are often used for guiding pallets. Guiding pallets via flanges increases the power demand and must be taken into account during the dimensioning of the drive and drive elements.

The maximum drive length to be moved by a drive is limited by the permissible load of the chain. The following factors determine the maximum drive length "L":

- The permissible tensile load of the chain F_{MAX} in N
- The gravitational force of the individual material to be transported F_T in N
- The roller resistance μ of the conveyor track, whereby a value of 0.1 is generally selected
- The projected conveying speed "S" in m/s
- The placement cycle "t" of the materials (in S), i.e. the time between two successive pieces of material to be conveyed

The maximum drive length "L" is being calculated:

$$L = \frac{F_{MAX} \cdot S \cdot t}{F_T \cdot \mu}$$

If the drive station is positioned in the middle of the conveyor for the drive from roller to roller, then twice the drive length can theoretically be implemented. The sprockets that transfer the drive output must not be overloaded in such a case.

Based on the overall efficiency of this system, long drive lengths should be avoided. In many cases, drive lengths of more than 15 m have proven to be problematic.

F_{MAX} can be determined with the permissible breaking load F_B of the chain used. A safety factor of 7 (for which the wear of the chain is also within an acceptable range) is generally used for this purpose so that F_{MAX} can be determined as follows:

$$F_{MAX} = \frac{F_B}{7}$$

According to DIN, the following breaking loads must be assumed:

Chain designation	Breaking load F_B	F_{MAX}
06B (3/8")	9100 N	1300 N
08B (1/2")	18,200 N	2600 N
10B (5/8")	22,700 N	3243 N

The drive output "P" required for maximum length can be calculated as follows:

$$P = \frac{L \cdot \mu \cdot F_T}{t}$$

Tangential transmission of force

The tangential chain drive is characterized by its good level of efficiency and simple design. The drive head (2) consists only of one sprocket. For this reason, the installation length of the conveyor roller is shorter for a roller-to-roller drive. A single chain (1) drives all of the rollers in a conveyor. The chain is guided to the sprockets by a chain guide profile. The chain guide profile (5) is usually made of special plastic and must guide the chain extremely precisely.

When used in fixed drive conveyors, the sprockets are permanently connected with the tube of the conveyors. Friction conveyors use rollers whose sprockets are not permanently connected with the outside tube. 1 to 2 teeth of the sprockets mesh into the chain and only transfer the driving power required for the individual roller. The chain can be guided either along the top of bottom of the conveyor rollers. The precise positioning of the chain guide in relation to the conveyor rollers is extremely important. The maximum play in terms of height is 0.5 mm. The central motor station (4) must be installed in such a way that the driving side of the chain is as short as possible. It is advisable to provide the motor station with additional equipment for adjusting the chain tension. Idler pulleys (3, 6) guide the chain at the drive and/or end of conveyor in the corresponding direction. It is also possible to use the last conveyor rollers as chain deflection. In this case, it must be ensured that these rollers feature a DIN gearing.

PLANNING BASICS

DRIVE ELEMENTS

Idler pulleys, which have to carry not only the load of the material to be conveyed, but also the chain traction forces, must be checked specifically with regard to their permissible bearing load. The driven conveyor length is restricted by the permissible breaking load of the chain and by the weight of the material to be conveyed.

The roller spacing (roller pitch) can be selected as required with tangential drives. Compared with roller-to-roller drives, the conveyor rollers are easy to fit and remove with tangential drives since they are not wrapped by the chain.

Starting at 1,000 operating hours, a lengthening of the chain of up to 2 % can be expected.

Wrapped force transmission

With wrapped force transmission, every conveyor roller is connected to the next one by a chain (1). For this reason the conveyor rollers require double sprocket heads (2). They need more space than with a tangential drive, so that the installation length of the roller is longer. Double sprocket heads always feature a DIN gearing (standard gearing).

An additional chain guide is not required. The roller pitch is subject to very tight tolerances and depends on the chain pitch.

$$t = P_c \cdot \frac{nc - nt}{2}$$

- t = Roller pitch
- nc = - Number of chain links
- nt = Number of teeth of drive head
- P_c = Chain pitch

The maximum conveyor length depends on the drive output of the motor station (3) and the permissible breaking load of the chain. The chain experiences its maximum load at the motor station. The tolerances for the roller pitch "Pr" and the breaking load are listed in the following table.

Chain pitch/ designation	P _c [mm]	Tolerance of Pr [mm]	Breaking load [N]	F _{max}
06B (3/8")	9.52	0 to -0.4	9100	1300 N
08B (1/2")	12.70	0 to -0.5	18200	2600 N
10B (5/8")	15.88	0 to -0.7	22700	3243 N

- P_c = Chain pitch
- Pr = Roller pitch

Toothed belt

The share of toothed belts as drive element in roller conveyor systems is declining. Toothed belts are generally used from roller to roller and are unable to negotiate curves. Compared to round or PolyVee belts, the power requirement of a toothed belt is significantly higher because of its design. This must be taken into account in the selection of the drive. Toothed belts pose a high demand on the tolerance of the roller pitch since the tooth engagement is form-fit with the profile of the drive head. Interroll recommends obtaining the tolerances to be followed from the manufacturer of the selected toothed belt.

One advantage of the toothed belt compared to round and PolyVee belts, is the fact that it passes movements without slipping when used properly. On top of that, toothed belts are low-noise and maintenance-free, lubricating or retensioning is not required.

The drive length of a conveyor with toothed belt drive should be dimensioned so that the overall load of 12,000 N conveying good being conveyed at the same time is not being exceeded.

For the roller series 3500 and the RollerDrive EC5000, a maximum toothed belt width of 12 mm and a Poly-Chain GT gearing is recommended.

PolyVee belt

PolyVee belts are ribbed V-belts that are generally used for the torque transmission from roller to roller in roller conveyor systems. The belts must feature a flexible tension member which renders them significantly less flexible than most round belts. Nevertheless, they can accept tolerances within the roller pitch because of their flexibility and used as drive elements in curves. For the installation of PolyVee belts, Interroll recommends the use of a PolyVee tensioning device, see page 179.

Compared to round belts, PolyVee belts can transfer a higher torque of up to 300 %, the service life is longer and, when used properly, a PolyVee belt does not slip over the drive head. In

start-stop operation, the rollers can be stopped more precisely and, compared to round belts, a higher number of conveyor rollers can be driven because of the high torque transmission.

Due to the design of the PolyVee drive head and the small width of the belts, they can be placed very close to the side profile. This leads to an optimal tube utilization for conveying goods. With the small diameter of the PolyVee drive head, any contact of PolyVee belt and conveying good is generally ruled out.

In container conveyor systems, 2-rib and 3-rib PolyVee belts are generally used. Interroll offers PolyVee belts for these designs for the most common roller pitches, see page 178. The 9-rib drive head also allows using 4-rib belts. The ability of high torque transmission also carries with it a high demand on safety. Injuries, such as jammed fingers between PolyVee belt and drive head, must be avoided. Interroll offers a finger guard for the most common roller pitches. It does not have to be fastened to the side profile and, for this reason, can be used for almost all side profiles, see page 179.

Round belt

Round belts, also referred to as O-rings, are available in different materials, colors and diameters. They are often used for the torque transmission from roller to roller. Round belts are cost-effective with respect to their purchase, are very flexible and can be installed with ease. The disadvantage is a relatively poor power transmission and relatively short service life. For this reason, the use of PolyVee belts predominates in conveyor systems.

The round belt guides with the RollerDrive EC5000 can be carried out via grooves in the tube or a round belt drive head. The drive head made from polyamide offers the advantage that the round belts can be guided closer at the end of the RollerDrive or at the side profile of the conveyor. In this case, it is more likely to separate torque transmission and running surface of conveying goods. Furthermore, the concentric precision is increased since no mechanical change of the tube occurs compared to grooves in the tube.

The round belt drive head offers a higher conveyance for most belts because of its material. This significant advantage must be taken into account if acceleration and deceleration for start-stop operation are so high that the belt briefly slips and wears out because of it. The better the conveyance from the guide, the higher the wear in this case. Groove solutions in tubes and also the round belt drive head offer 10 mm wide grooves. This allows using round belts with a maximum diameter of 6 mm. In case of higher round belt diameters, there is the risk of two contact points of the round belt – at the bottom and at the side of the groove. In this case, the belt is subjected to two different speeds and experiences above average wear.

Flat belt

Flat belts are used for tangential force transmission. In this case, the flat belt is guided under the rollers and, in each case, pressed against a part of the roller. This can be the tube or a drive head. Flat belts are used to construct fixed drive conveyors and friction conveyors. It is also possible to drive zero-pressure accumulation conveyors with flat belts. In such a case, the flat belt is permanently driven. Stopping subsections is done by decoupling the roller with the moving flat belt. Given the constantly turning central drive, this type of zero-pressure accumulation conveying leads to significantly higher energy consumption. Interroll recommends the use of RollerDrive as an alternative.

Flat belts hardly ever need any maintenance. A precise guiding of the belt is required. The flat belt is generally put in motion by a gear motor can must be brought to a pretension of approx. 1 % with a tensioning device. The drive power is generally transmitted more reliably if the loop angle of the flat belt on the roller can be increased with narrowing wheels.

Interroll offers different products for the use of flat belts. The conveyor rollers of series 1700 are frequently used for fixed drive conveyors. The series 3500 as fixed drive head is available with a flat belt drive head. The series 3800 offers friction solutions for flat belts. And the series 2600 offers several pressure rollers to guide and press on flat belts.

Friction rollers

Introduction

If materials are accumulated on a roller conveyor and the rollers continue to be driven, it creates accumulation pressure. This accumulation pressure continues to grow the more materials are being driven by rollers. As a result, it can damage the underside of the material to be conveyed. In addition, it is possible that the first piece of material, which is generally stopped by a mechanical stopper, will be squashed. Friction rollers prevent these problems by reducing the accumulation pressure.

Friction rollers are based on the principle of the slip coupling. In this case, the friction force in the coupling must overcome the rolling friction between material and roller. Friction rollers offer the option of setting up accumulation conveyors with minimal accumulation pressure. When materials are stopped, the rollers will also stop. The drive of the friction rollers continues to turn in this case. When the stop is canceled, the complete roller units turn again and move the materials. In this case, the conveyance is load-dependent.

The bearing housing of the series 3800 is designed as a greased-for-life slip coupling and guarantees the roller's constant conveyor force. A tangential drive has proved itself to be especially economical when used on friction conveyors. For this

PLANNING BASICS

FRICION ROLLERS

purpose, a central drive moves a long chain or a flat belt. The flat belt or the chain are guided past the drive unit underneath the conveyor rollers so that all conveyor rollers are operating.

Application notes

- Conveying goods
 - Even and stable bases of the conveying goods are ideal so that each friction roller carries the material evenly. Soft, lightweight or uneven conveying goods, e.g. cardboards, can be unsuitable for a friction conveyor.
 - Only those conveying goods can be used that prevent a mutual lifting out because of their shape. If necessary, the number of conveying goods to be accumulated must be restricted.
 - Round conveying goods are generally not suitable since they distribute randomly on the conveyor during accumulation. To prevent round conveying goods from falling off of the conveyor during accumulation, a suitable side guide is required.

- The conveyor force, which is produced by the friction roller by means of friction, regulates itself relative to the weight of the conveying good. The conveyor force is seriously affected by the following factors:
 - Weight of conveying good
 - Base condition of conveying good
 - Position of conveying good
 - Humidity
 - Temperature
 - Percentage of accumulation mode over the entire running time
- These factors have, to an extent, a considerable effect on the operation and operational lifespan of the conveyor roller. The task is to find out the sufficient conveyance for the respective conveying good to be conveyed. A dimensioning test under original conditions is generally required for this purpose.
- To enable starting up the conveyor even with complex conveying goods, the following measures may be helpful:
 - Selection of the correct friction roller. An adjustable or a double friction roller may be better suited.
 - Reducing the roller pitch: With less load on each roller, its conveyance ability is also reduced.
 - Creating a contact pressure from the drive head onto the bearing housing in axial direction.
 - Design of a minor incline in conveying direction
 - Duration of accumulation mode

- Accumulation mode should only be used for as long as is necessary. When it can be seen that no conveyance will take place, then the central drive should be switched off. No energy will be used and the service life of the conveyor system will be increased. An overtemperature of the abrading polymer elements must be avoided.
- For long accumulation mode, steel sprocket drives offer an improved dissipation of the friction heat.
- Placement of conveying good
 - If the conveying good is significantly narrower than the friction roller, it can affect the conveyance ability. With single friction rollers, the conveyance decreases the further away the conveying good is from the friction drive.
 - The same applies to the center of gravity of a conveying good. The closer the center of gravity is to the friction drive, the better the conveyance.
- Friction roller
 - Flanges as well as other side guides cannot be used for friction rollers. The friction that is being created could possibly not be overcome by the conveyor force of the friction coupling.
 - The use of friction rollers represents a minimum requirement on the tolerance of the installation height of the rollers. If a friction roller that is installed at a low level is followed by a roller installed slightly higher, this may represent an interfering edge to the conveying good that cannot be overcome.
 - When using tube sleeves (e.g. PVC sleeves), a maximum sleeve material thickness of 2 mm is recommended.
- The maximum permissible conveying speed is 0.5 m/s.
- Use only under dry conditions
- The bearing housings that are part of the friction element, contain pockets. These pockets are filled with special grease. The grease must not be removed! It allows better startup values, due to the high adhesive force of the grease. In addition, friction heat that is being created, is dissipated better through the grease, and the wear of the polymer parts is reduced.
- The conveyance values listed below are non-binding. They refer to standard climate (65 % relative humidity and a temperature of +20 °C) and conveying good positioned in the center.

Conveyor force	Friction	Ø Friction roller [mm]
4 – 6 %	One-sided friction element	50
2 – 5 %	One-sided friction element	60
8 – 13 %	Two-sided friction element	30/50/60/80
4 – 6 % (12 %)	One-sided, adjustable friction element	50/60

Functional differences

Series 3800

Series 3800 offers different drive heads. A drive head is set in motion using a drive element and turns inside the bearing housing. The bearing housing applies force onto the drive head with the weight of tube and material to be conveyed. This friction force causes the conveyance of bearing housing and tube. The material to be conveyed is moved through the rotation of the tube.

If the material is stopped, the tube stops and the drive head turns inside the bearing housing.

The product description of series 3800 is located on page 112.

Series 3800 – adjustable

With the adjustable series 3800, a 1/2" steel sprocket drive head with 14 teeth is available, whereby the operating principle corresponds to the one described above. In addition, a male threaded shaft protrudes from the roller on the other side of the drive head. There is a nut and a spring on the shaft. Tightening the nut tensions the spring, which exerts an axial force from the drive head onto the bearing housing. This axial force increases the conveyance to up to 12 % of the roller load. The more the nut is tightened, the earlier the tube is turning.

The product description of the series is located on page 112.

Series 3800 light

The series 3800 light offers a single friction solution as well as a double friction solution. The rollers have a diameter of 30 mm. The single friction rollers are equipped with steel sprocket heads and the double friction rollers with polymer drive heads for flat belts. The operating principle of the single friction corresponds to that of series 3800 and that of the double friction to that of series 3870.

The product description of series 3800 light is located on page 108.

Series 3870

Series 3870 offers different polymer sprocket heads. A drive head and a bearing assembly on the other side are pressed into an internal tube. This unit is integrated into the external tube. The operating principle corresponds to series 3800, whereby the internal tube rotates in the two bearing housings of the external tube. If a material to be conveyed is stopped, the drive head turns together with the internal tube, and the external tube is standing still. The advantage of this solution is that both sides of the roller feature a friction unit and conveyor force is generated with an off-center load.

The product description of series 3870 is located on page 122.

How to build a curve?

It is possible to build roller curves with cylindrical rollers. With such a design, materials to be conveyed are not conveyed in the center of the curve, but alongside a required side guide. This requires more energy and it poses the risk of damage to the side guide or material that is being conveyed. For this reason, the design with tapered conveyor rollers is recommended.

The diameter of the tapered rollers increases towards the direction of the outside curve diameter. With the increasing diameter, the circumferential speed increases. This allows materials to be transported through the curve without losing their orientation. With the usual speeds (max. 0.8 m/s) and ideal curve design, a side guide is not required.

Interroll offers different curve-capable rollers that feature the designation KXO. These are rollers with cylindrical steel tube onto which tapered elements are pushed. The following series are suitable for use in roller curves.

PLANNING BASICS

HOW TO BUILD A CURVE?

Series	Based on Ø [mm]	Conicity	Drive elements
3500KXO light	20	1.8°	Round belt
1700KXO	50	1.8° and 2.2°	Round belt
3500KXO	50	1.8° and 2.2°	Round belts, PolyVee belts, chains

Curve dimensioning

Based on this curve diagram, Interroll recommends the following steps:

EL	Installation length of the conveyor roller	R _i	Internal radius of the curve
L	Max. conveying good length	P _o	Roller pitch on the external diameter
W	Max. conveying good width	P _i	Roller pitch on the internal diameter
R _o	External radius of the curve		

- Curve definition
 - Driven or non-driven curve
 - With driven curves, determination of the drive elements (see sub-chapter Drive elements on page 191)
- Selection of the roller series (drive element, based on a diameter of 20 or 50 mm)
 - Series 3500KXO light see page 94
 - Series 1700KXO see page 68
 - Series 3500KXO see page 98
- Determining the dimensions of the largest possible conveying good

- Selecting the inside radius (note under "Radii")
- Calculating the minimal outside curve radius R_o

$$R_o = 50 \text{ mm} + \sqrt{(R_i + W)^2 + \left(\frac{L}{2}\right)^2}$$
- Calculating the minimal installation length of the conveyor rollers

$$\text{Installation length } EL_{\text{MIN}} = R_o - R_i$$
- The reference lengths of the rollers are calculated based on the lengths of the tapered tube sleeves. The lengths must be greater than the calculated installation length.
- Calculating the actual installation length of the selected curve roller (see the note in the respective chapter of the roller series)
- Calculating the actual outside curve radius R_o

$$R_o = EL + R_i \text{ with selected standard EL}$$
- Determining the roller pitch at the inside diameter or angle between the rollers
- Calculating the roller pitch at the outside diameter P_o

$$P_o = P_i \cdot \frac{R_o}{R_i}$$

Installing the rollers/RollerDrive

For the curve construction, it must be taken into account that the top side of the curve RollerDrive is level. Hence, the fastening shaft is not horizontal. As a result, vertically arranged side profiles do not have a 90° angle. For this reason, Interroll recommends an angle compensation so that the fastening shaft does not experience any warping. The EC3500 with protection rating IP54 is exclusively available for installation in the curve.

The installation length of curved sections must be longer than that of straight sections to ensure that the conveying good does not touch the side guide in the curve. Please select the next larger installation length grid.

Drive

The RollerDrive has established itself as the drive for powered roller curves. It allows implementing a cost-efficient, compact and quiet curve. RollerDrive in conjunction with PolyVee belts as drive element are the simplest solution for torque transmission in curves. Such curves can be constructed and set up in an easy way – for constantly rotating as well as for curves for start-stop operation.

Drive element

Round belts and PolyVee belts are suitable as drive element.

Round belts can be guided via grooves which are located in the area of a tube projection. As an alternative, round belts can also be guided via a drive head at the inside radius.

PolyVee belts are exclusively guided via a drive head, also at the inside radius.

The most frequent solution is the PolyVee belt. For use in curves, 2-rib and 3-rib flexible belts are suitable. The belts must occupy the first grooves from the direction of the inner curve radius. A distance of one groove is required between the two belts.

Length of tapered elements

1.8° elements: The first tapered element has a length of 45 mm or 95 mm. All additional elements have a length of 100 mm. The total length of the tapered elements can be selected in increments of 50 mm. The different lengths of the first tapered elements result in 2 different inside curve radii.

2.2° elements: The length of the first tapered is always 140 mm. Hence, the inner curve radius does not vary.

Radii

Different inside curve radii can be created with the different Interroll Curve Rollers. A material will be conveyed perfectly through a curve only if the radii are being maintained.

Curve rollers of series 1700KXO and 3500KXO can be manufactured with a tube projection. It is possible that the tube projection is located on the side of the tapered element with the smaller diameter. The first tapered element will then have the corresponding distance to the curve side profile. With this design, it must be taken into account that the inner curve radius must be reduced with a tube projection of more than 20 mm. A tube projection on the side of the tapered element with the larger diameter does not have any effect on the inner curve radius.

Inside curve radii for rollers with PolyVee or round belt drive head

Inner curve radius	Conicity	Roller series	Roller reference lengths [mm]
660 mm	2.2°	3500KXO	190, 240, 290, 340, 440, 540, 640, 740
820 mm	1.8°	3500KXO	150, 250, 350, 450, 550, 650, 750, 850, 950
770 mm	1.8°	3500KXO	200, 300, 400, 500, 600, 700, 800, 900, 1000

Inner curve radii for non-driven rollers

Inner curve radius	Conicity	Roller series	Roller reference lengths [mm]
357 mm	1.8°	3500KXO light	150, 250, 350, 450, 550
357 mm	1.8°	3500KXO	200, 300, 400, 500, 600
690 mm	2.2°	1700KXO	190, 240, 290, 340, 440, 540, 640, 740
850 mm	1.8°	1700KXO	150, 250, 350, 450, 550, 650, 750, 850, 950
800 mm	1.8°	1700KXO	200, 300, 400, 500, 600, 700, 800, 900, 1000

PLANNING BASICS

HOW TO BUILD A CURVE?

Inner curve radii for rollers driven via chain

Inner curve radius	Conicity	Roller series	Roller reference lengths [mm]
690 mm	2.2°	3500KXO	190, 240, 290, 340, 440, 540, 640, 740
850 mm	1.8°	3500KXO	150, 250, 350, 450, 550, 650, 750, 850, 950
800 mm	1.8°	3500KXO	200, 300, 400, 500, 600, 700, 800, 900, 1000

Inside curve radii for rollers with grooves

Grooves are applied within a tube projection at the inner curve radius. The table "Inside curve radii for non-driven curves" lists the curve radii for the rollers of series 1700KXO. The tube projection must then be subtracted from the corresponding curve radius.

Roller pitch

The roller pitch depends on the selected drive element.

PolyVee belt: For example, if a PolyVee belt is used in the curve for a roller pitch of 75 mm, then a hole pitch of 73.7 mm must be planned at the inside radius. When using rollers with a conicity of 2.2° and PolyVee belts for a roller pitch of 60 mm, then a hole pitch of 58.7 mm must be planned at the inside radius. The roller pitch at the outside radius can be calculated using the following formula:

$$P_o = P_i \cdot \frac{R_o}{P_i}$$

P_o = Roller pitch on the outside diameter

P_i = Roller pitch on the inside diameter

R_o = Outside radius of the curve

Interroll recommends an angle of 5° between two rollers. The angle must not be greater than 5.5°.

Round belts: Any length can be used here. To ensure a sufficient distance of the rollers, Interroll recommends not to plan more than 22 rollers in a 90° curve. This also applies to non-driven curves.

Chains: The chain as drive element allows only a limited number of roller pitches. The roller pitch is always a multiple of the 1/2" chain pitch and can be calculated as follows:

$$P_{Chain} = \frac{(N_T - N_c)}{2} \cdot 12,7$$

P_{chain} = Chain pitch

N_c = Number of teeth

N_T = - Number of chain links

The calculation of the roller pitch is performed at the outside radius. With a roller-to-roller drive, the inside and outside sprockets are used alternately. The roller pitch should be dimensioned so that a chain on the outside sprockets is perfectly tensioned. With the same roller pitch in the curve, the chain on the inside sprockets will be tensioned a little bit less because of the reduced distance of the sprockets to each other.

The roller pitches at the inside and outside radius must be calculated on the basis of the chain pitch.

PLANNING BASICS

DIMENSIONING OF MAGNETIC SPEED CONTROLLER

The following theoretical pitches (measured at the sprocket with a pitch of 1/2" and 14 teeth) have been proven and tested:

Number of chain links	Pitch measured on the sprocket [mm]
28	88.9
30	101.6
32	114.3
34	127.0
36	139.7
38	152.4

The following information on the number of conveyor rollers required relates to a 90° curve on which a higher surface to the 90° angle of the side frame has been designed in for equalization.

Reference length [mm]	Pitch measured on the sprocket [mm]					
	88.9	101.6	114.3	127.0	139.7	152.4
250/300	19	16	14	13		
350/400	20	18	16	14	13	
450/500		19	17	15	14	13
550/600		21	18	17	15	14
650/700			20	18	16	15
750			21	19	17	16
800				19	17	16
850/900				20	18	17

Number of rollers

The calculation or determination of the roller pitch and the angle of the roller curve result in the number of rollers to be used, which is not always an even number. In this case, the value must be rounded up or down.

If a PolyVee belt is used in the curve for a roller pitch of 73 mm (based on a straight conveyor line), it results in an even roller count for the following curve angles:

Bracket	Number of rollers
30°	6
45°	9
90°	18
180°	36

Speed

For a conveying good to be conveyed perfectly through the curve, the curve speed and the speed of the straight conveyor line must be identical before and after the curve. The curve speed refers to the average speed. If the speeds of straight and curve are different, the conveying good can lose its orientation and, as a result, reach the side guide.

Different forces occur in a curve. If the centrifugal force is greater than the static friction force, conveying goods will almost always lose their orientation. This occurs at speeds over approx. 0.8 m/s. At that point, conveying goods will no longer be conveyed through the center of the curve and come into contact with the side guide at the outside radius. This depends on various factors, such as material and condition of the underside of the conveying good, and these factors should also be taken into account during the planning of the curve.

Tapered elements of conventional curve rollers carry the risk of shifting on the tube. Interroll secures the tapered elements without creating an interfering edge that is visible on the outside.

Deep freezing

Roller curves can also be operated in the deep freeze area. An ideal drive is the RollerDrive EC5000 in deep freeze design. Driven rollers should feature oiled ball bearings so that the required drive power is not increased unnecessarily. Interroll recommends PolyVee belts as drive element. They have to be watched for suitability for deep freezing and that the belt tension is not too high.

Dimensioning of magnetic speed controller

The Magnetic Speed Controller MSC 50 is a mechanical speed controller that ensures a controlled speed on gravity conveyors with conveying goods weighing up to 35 kg.

In contrast with conventional products, the speed controller operates without a gear box, thus enabling startup for very lightweight containers starting at 0.5 kg. The maximum mechanical output is 28 W, thus providing the required

PLANNING BASICS

DIMENSIONING OF MAGNETIC SPEED CONTROLLER

consistently high braking power for heavy containers. The operating principle is based on an eddy current brake. A double shielding of the magnets enables a uniform braking action.

Conventional products often contain brake shoes. The heavier a conveying good, the stronger the braking of these brake elements. This purely mechanical braking process causes wear. It means that such products have to be replaced after a certain time since the brake shoes are worn off. Such a wear does not take place in the MSC 50.

The hexagon shaft used serves the torque within the side profile. A loose, form-fit installation of the hexagon shaft is possible with hexagon holes in the side profiles. A hole size of 11.5 mm is required for an oblique installation. With a fixed installation using a female threaded shaft, a minimum torque of 20 Nm must be applied. Interroll recommends the additional use of a screw locking device.

The speed controller without PU sleeve is manufactured with a tube diameter of 51 mm. Together with conveyor rollers of 50 mm diameter, a minimum higher surface of 0.5 mm is created. This provides sufficient contact to the conveying good, which leads to an optimal braking function.

The distribution, number and design of the speed controller in a conveyor track depends on many parameters:

- Incline of conveyor track
- Roller pitch
- Infeed speed, e.g. by a sorter
- Conveying good weight
- Condition of the underside of the conveying good

The data listed below has been determined by means of numerous tests. Conveying goods with optimal undersides were used for this purpose. The data is intended to provide a reference point for the dimensioning of applications, whereby the combination of critical parameters is very large. Due to the multitude of influencing factors, Interroll cannot provide specific information about conveying speeds and, for this reason, recommends to empirically determine the final layout:

- Lightweight conveying goods can run very slowly (approx. 0.01 m/s).
- Under optimal conditions, heavy conveying goods can run at 0.5 m/s.
- The design with PU sleeve is intended to improve the static friction for smooth plastic containers. The PU sleeve is particularly recommended in combination of conveyor tracks with large inline and high conveying good weights.
- For cardboard boxes and many other conveying goods, the friction in combination with a zinc-plated steel tube is sufficient.
- Inclines from 5 % to 10 % were examined in numerous tests. The following distances between the Magnetic Speed Controllers were tested successfully:

Conveying good weight [kg]	Distance of MSC 50 [mm]
0.5 to 10	Maximum 2000
10 to 20	800 to 1500
20 to 35	Adjusted to the length of the conveying good

- With infeed speeds into the gravity conveyor greater than 1 m/s, Interroll recommends the installation of three to four MSC 50 at the beginning of the gravity conveyor. The placement on the first 1,000 mm is used for immediate reduction of the speed. On the rest of the gravity conveyor, the distance values specified above can be applied as guide values.

Material specification

Tubes

Material	Standards	Specification
Uncoated steel, zinc-plated steel	DIN EN 10305-1 DIN EN 10305-2 DIN EN 10305-3	Limited tolerances and material specifications by Interroll
Zinc-plating	DIN EN ISO 2081 DIN 50961	Galvanized zinc sleeve with additional blue passivation (chromium VI-free) Sleeve complies with RoHS regulations Plating thickness 6 to 15 µm
Stainless steel	DIN EN 10296-2	1.4301 (X5CrNi18-10) and 1.4509 (X2CrTiNb18) Limited tolerances by Interroll
Aluminum	DIN EN 754-1+2 (Ø20) DIN EN 755-1+2 (Ø50)	AW 6060 T66 (AlMgSi 0.5 F22) For 20 mm E6/EV1, stained, natural and anodized Surface layer thickness 20 µm, isolating and non-conductive For 50 mm mill-finished, unfinished, thus conductive
PVC	–	PVC-U (rigid polyvinyl chloride, softener-free, silicon-free, highly impact-proof) Contains only materials, which have been tested and registered to comply with the REACH Directive (EC No. 1907/2006) RAL7030 (stone gray) RAL7024 (dark gray) RAL5015 (sky blue)

Bearings

Precision ball bearings, lubricated (689 2Z, 6002 2RZ, 6003 2RZ, 6204 2RZ, 6205 2RZ), used by Interroll:

Standard	DIN 625
Material	Rings and balls are made of stainless steel of material grade 100Cr6 Hardness: 61 ± 2 HRC, with metal cages
Bearing play	C3
2RZ Seal	Non-grinding 2-lip seal with labyrinth effect manufactured from steel-reinforced acrylonitrile-butadiene rubber (NBR)
2Z Seal	Non-grinding cover discs made of sheet steel
Lubrication	Multi-grade grease, silicon-free

MATERIAL SPECIFICATION

Polymers

Interroll uses components made of polymer in almost all conveyor elements. Polymer has many advantages over steel:

- Sound reduction
- Easy to clean
- Excellent impact strength
- Corrosion resistance
- Lightweight
- High quality design

Properties and applications

Polymer	Properties	Uses
Polyamide (PA)	<ul style="list-style-type: none"> • Outstanding mechanical properties • Excellent wear resistance • Low coefficient of friction • Good chemical resistance 	Sprocket drive heads, seals and bearing seats
Polypropylene (PP)	<ul style="list-style-type: none"> • Low specific weight • Excellent heat resistance • Not hygroscopic • Good chemical resistance 	Wheels, seals and bearing seats
Polyvinyl chloride (rigid PVC)	<ul style="list-style-type: none"> • Scratch-resistant • Impact-resistant • Good chemical resistance 	Tubes for polymer conveyor rollers
Polyoxymethylene (POM)	<ul style="list-style-type: none"> • Outstanding mechanical properties • Excellent wear resistance • Low coefficient of friction • Very dimensionally stable • Minimal absorption of water • Used on parts which require a very high level of precision 	Toothed belt drive head and slide bearing

Resistance

Symbol	Meaning	Explanation
++	Very good resistance	Continuous exposure to the medium causes no damage
+	Generally resistant	Continuous exposure to the medium can cause damage, which is reversible when no longer exposed to the medium
-	Mostly non-resistant	Only resistant if there are optimum ambient and application conditions but generally some damage is to be expected
--	Completely non-resistant	The medium may not come into contact with the polymer

The resistance of the polymers is affected by temperature, exposure to force, UV exposure, and the duration of exposure and concentration of the medium.

A thorough suitability test of the polymer to be used by the user is indispensable. The following overview serves as orientation aid.

PLANNING BASICS

MATERIAL SPECIFICATION

Product	Polyamide (PA)	Polyoxymethylene (POM)	Soft PVC	Rigid PVC	Polypropylene (PP)
Ethers	++	++	-	++	-
Lower alcohols	++	++	++	-	++
Petrol	++	+	--	++	-
Esters	++	--	--	--	-
Fats	++	++	-	++	+
Hydrofluoric acid	--	--	-	-	-
Ketones	++	-	--	--	++
Aliphatic hydrocarbons	++	++	--	++	++
Aromatized hydrocarbons	++	+	--	--	-
Chlorinated hydrocarbons	-	++	--	--	--
Unsaturated, chlorinated hydrocarbons	+	++	--	--	--
Weak bases	+	++	++	++	++
Strong bases	-	++	-	++	++
Mineral oil	++	++	-	++	-
Oils	++	++	-	++	+
Oxidizing acids	--	--	-	--	--
Weak acids	--	-	++	++	++
Strong acids	--	--	++	-	--
Strong, organic acids	-	++	-	+	++
Inorganic salt solutions	++	++	++	++	++
Turpentine	-	-	--	--	--
Fuel mixture	+	++	--	--	-
Water	++	++	++	++	++

INDEX

Interroll from A to Z

A

Adjustable friction roller	112
Axial play	15

B

Ball bearing	11, 195
Bearings	11, 195

C

Chain	184
Concentric precision	20
Contact guard	179
Conveying good	180
Curve	189
Curve rollers	68, 94, 98

D

Double friction roller	108, 122, 187
Drive concepts	182

F

Finger guard	179
Finishing of shell materials	18
Flanges	27
Flat belt	82, 184
Flat belt drive head	82, 98
Friction rollers	108, 112

G

Gravity roller	32
Grooves	60, 68

I

Interroll Group	6
-----------------	---

L

Lagging	26
---------	----

M

Magnetic speed controller	134, 193
Moist area	50

N

Noise reduction	30
-----------------	----

O

O-Ring	148
--------	-----

P

Pallet rollers	44, 128
Platforms	8
PolyVee belt	178, 184
PolyVee finger guard	179
PolyVee rollers	82, 98
PolyVee tensioning device	179
Precision ball bearing	195
PU sleeve	25
PVC sleeve	23

R

Roller pitch	181, 184, 189
Roller track	164, 166, 172
Round belt	148
Round belt drive head	82

S

Shaft adapter	16
Shaft designs	12
Shafts	12, 197
Slide bearing	50
Smooth-running conveyor roller	32
Speed controller	134, 193
Sprocket	78, 82, 98, 104, 108, 112, 122, 128, 184
Straightened rollers	22

T

Tapered rollers	68, 94, 98
Tensioning device	179
Toothed belt	82
Toothed belt drive head	82
Tube material	16, 195

U

Universal conveyor roller	60
---------------------------	----

V

Variable shaft length	15
-----------------------	----

Z

Zero-pressure accumulation conveying	182
Zinc-plating	18, 195
